

## Soil, land and climate change

Soil contains significant amounts of carbon and nitrogen, which can be released into the atmosphere depending on how we use the land. Clearing or planting forests, the melting of permafrost can tilt the greenhouse gas emission balance one way or the other. Climate change can also substantially alter what farmers can produce and where.

**Effects of Land-Use Change on Atmospheric CO<sub>2</sub> Concentrations** Virginia H. Dale, 2012-12-06 Roger C Dahlman Environmental Sciences Division U S Department of Energy Washington D C The potential for humans to alter Earth's atmosphere has been recognized since the end of the 19th century when Arrhenius estimated that a doubling of atmospheric carbon dioxide could alter the atmospheric radiation balance and raise average global temperature Today atmospheric CO concentrations play an important part in the 2 climate change debate Sources and sinks of CO associated with land use can be 2 significant determinants of the rate and magnitude of atmospheric CO change 2 Combustion of fossil fuels and the deforestation associated with land use change both contribute CO to the atmosphere in contrast biological processes on land create 2 potential sinks for the excess CO Thus land use change and associated biological 2 processes become important elements in assessments of future atmospheric CO 2 increase land cover properties also affect the Earth's albedo which is a climate feedback

**Global Environmental Change and Land Use** H.J.T.M. Haarman, Jan Verhagen, C.A. Rovers, 2003-06-30 The interaction between environmental change and human activities is complex requiring the concepts and tools of a number of disciplines for its effective analysis Land use and land cover change has only recently become a topic susceptible to scientific research as these concepts and tools have been developed and made available Rooted in a broad community concerned with global change systematic research has begun into land use systems at different scales and interactions and their links with global cycles of water nitrogen and carbon are being explored Partly based on research initiated by the Dutch National Research Programme on Global Air Pollution and Climate Change NRP this book touches upon various land use and land

cover issues in relation to global environmental change In addition to the biogeochemical cycles land as a carrier for functions of economic activities food and fibre production and energy production via biomass are discussed Crucial in studying land use is human behaviour and man environment interaction at different scales Land use and land cover change is an important contributor of greenhouse gases as these activities directly interfere with the carbon nitrogen and water cycles These cycles are connected through numerous feedback loops The interface of land use and climate is essentially determined by the interaction of man and the environment Man uses land primarily to produce food a relatively small area is needed for urban development
