## **Efficient C Performance Programming Techniques:**

Efficient C++ Dov Bulka, David Mayhew, 2000 Far too many programmers and software designers consider efficient C to be an oxymoron They regard C as inherently slow and inappropriate for performance critical applications Consequently C has had little success penetrating domains such as networking operating system kernels device drivers and others Efficient C explodes that myth Written by two authors with first hand experience wringing the last ounce of performance from commercial C applications this book demonstrates the potential of C to produce highly efficient programs The book reveals practical everyday object oriented design principles and C coding techniques that can yield large performance improvements It points out common pitfalls in both design and code that generate hidden operating costs This book focuses on combining C's power and flexibility with high performance and scalability resulting in the best of both worlds Specific topics include temporary objects memory management templates inheritance virtual functions inlining reference counting STL and much more With this book you will have a valuable compendium of the best performance techniques at your fingertips

knowledge on modern organizations and the complications of the current globalized computing environment Provided by publisher *Object-Oriented Design Choices* Adair Dingle, 2021-01-19 Do modern programming languages IDEs and libraries make coding easy Maybe but coding is not design Large scale or expensive apps clearly require evaluation of design choices Still software design directly impacts code reuse and longevity even for small scale apps with limited overhead This text evaluates and contrasts common object oriented designs A given problem may have many solutions A developer may employ different design techniques composition inheritance dependency injection delegation etc to solve a particular problem A skilled developer can determine the costs and benefits of different design responses even amid competing concerns A responsible developer documents design choices as a contract with the client delineating external and internal responsibilities To promote effective software design this book examines contractual object oriented designs for immediate and sustained use as well as code reuse The intent of identifying design variants is to recognize and manage conflicting goals such as short versus long term utility stability versus flexibility and storage versus computation Many examples are given to evaluate and contrast different solutions and to compare C and C effects No one has a crystal ball however deliberate design promotes software longevity With the prominence of legacy OO code a clear understanding of different object oriented designs is essential Design questions abound Is code reuse better with inheritance or composition Should composition rely on complete encapsulation Design choices impact flexibility efficiency stability longevity and reuse yet compilers do not enforce design and syntax does not necessarily illustrate design Through deliberate design or redesign when refactoring developers construct sustainable efficient code **Formal Methods for Performance Evaluation** Marco Bernardo, Jane

Hillston, 2007-06-06 This book presents a set of 11 papers accompanying the lectures of leading researchers given at the 7th edition of the International School on Formal Methods for the Design of Computer Communication and Software Systems SFM 2007 held in Bertinoro Italy in May June 2007 SFM 2007 was devoted to formal techniques for performance evaluation and covered several aspects of the field Modern Advances in Software and Solution Algorithms for Reservoir Simulation

Rami Mustafa Younis, 2011 As conventional hydrocarbon resources dwindle and environmentally driven markets start to form and mature investments are expected to shift into the development of novel emerging subsurface process technologies While these processes are characterized by a high commercial potential they are also typically associated with high technical risk The time to market along comparable development pipelines such as for Enhanced Oil Recovery EOR methods in the Oil and Gas sector is on the order of tens of years It is anticipated that in the near future there will be much value in developing simulation tools that can shorten time to market cycles making investment shifts more attractive There are two forces however that may debilitate us from delivering simulation as a scientific discovery tool The first force is the growing nonlinearity of the problem base The second force is the flip side of a double edged sword a rapidly evolving computer architecture scene The first part of this work concerns the formulation and linearization of nonlinear simultaneous equations

the archetypal inflexible component of all large scale simulators The proposed solution is an algorithmic framework and library of data types called the Automatically Differentiable Expression Templates Library ADETL The ADETL provides generic representations of variables and discretized expressions on a simulation grid and the data types provide algorithms employed behind the scenes to automatically compute the sparse analytical Jacobian Using the library large scale simulators can be developed rapidly by simply writing the residual equations and without any hand differentiation hand crafted performance tuning loops or any other low level constructs A key challenge that is addressed is in enabling this level of abstraction and programming ease while making it easy to develop code that runs fast Faster than any of several existing automatic differentiation packages faster than any purely Object Oriented implementation and at least in the order of the execution speed of code delivered by a development team with hand optimized residuals analytical derivatives and Jacobian assembly routines A second challenge is in providing a generic multi layered software framework that incorporates plug in low level constructs tuned to emerging architectures The inception of the ADETL spurred an effort to develop the new generation AD GPRS simulator which we use to demonstrate the powers of the ADETL We conclude with a thought towards a future where simulators can write themselves The second part of this work develops nonlinear methods that can exploit the nature of the underlying physics to deal with the current and upcoming challenges in physical nonlinearity The Fully Implicit Method offers unconditional stability of the discrete approximations This stability comes at the expense of transferring the inherent physical stiffness onto the coupled nonlinear residual equations that are solved at each timestep Current reservoir simulators apply safe guarded variants of Newton s method that can neither guarantee convergence nor provide estimates of the relation between convergence rate and timestep size In practice timestep chops become necessary and they are guided heuristically With growing complexity convergence difficulties can lead to substantial losses in computational effort and prohibitively small timesteps We establish an alternate class of nonlinear iteration that converges and that associates a timestep to each iteration Moreover the linear solution process within each iteration is performed locally Several challenging examples are presented and the results demonstrate the robustness and computational efficiency of the proposed class of methods We conclude with thoughts to unify timestepping and iterative nonlinear methods
