

# Selecting Road-Noise Abatement Measures: Economic Analysis of Different Policy Objectives

**Abstract:** To satisfy new legislation, the Norwegian Public Roads Administration implemented a national façade insulation program encompassing 2,500 dwellings exposed to high levels of road traffic noise. Thereby, the road owner brought the equivalent noise levels from road traffic in compliance with a new indoor limit of 42dB. Cost-effectiveness analyses show that façade insulation was the least expensive noise-control alternative per dwelling. However, cost-benefit analyses show that the benefits were less than 20 per cent of costs. One reason for the poor benefit-cost ratio is that only the residents of the targeted dwellings benefit from at-receiver measures. Measures at the source and/or targeting the propagation paths also provide noise benefits for residents living along the same streets as the most noise exposed and inadequately insulated dwellings.

A mixed noise abatement policy employing low-noise asphalts in addition to façade insulation is therefore considered. For 750 dwellings where two or more of the dwellings were located along the same road stretch, low noise asphalts replaced façade insulation as noise abatement method. Façade insulation was kept as noise abatement method for the remaining 1,750 dwellings. The mixed noise abatement policy costs more, but now provides total benefits that match the total costs.

Even higher benefit-cost ratios are obtained when reframing the economic analyses within the context of a national policy to reduce noise annoyance, and when focussing solely on more densely populated areas where low-noise asphalts is a viable alternative to façade insulation. Since environmental authorities are in the process of further lowering the indoor noise limit, the road authorities should consider preparing an organisational and financial framework for implementing low-noise surfaces based on cost-benefit calculations. Such a policy would have the added benefit of improving urban soundscapes for a significant number of residents, workers, cyclists, pedestrians and children.

**Keywords:** Environmental limits, façade insulation, low-noise asphalt, noise measures, noise policy, dual objectives, soundscape.

## 1. INTRODUCTION

Traffic noise became the subject of Norwegian pollution regulation in 1997, regulation specifying that indoor equivalent noise levels should not exceed 42 decibels (dB). Where indoor noise levels exceeded the new environmental limit, infrastructure owners, among them, the Norwegian Public Road Authorities, were obliged to comply with the new regulations before the year 2005. One measure reducing indoor noise exposure, indoor noise annoyance and sleep disturbance is façade insulation [1-3]. To meet the new noise limits, the Norwegian Public Road Authorities introduced a façade insulation programme affecting 2,500 dwellings nationally and, to capitalize on the research opportunity presented, the Norwegian Façade Insulation Study [4] was realised.

The first round of results from the Norwegian Façade Insulation Study shows that respondents receiving façade insulation benefited significantly and substantially from the measure [5]. However, since noise abatement using façade insulation is costly, economic analyses were undertaken as part of the Insulation Study. Here, we examine this clean-up

effort along the roads, focussing on how an alternative mix of noise-abatement measures would have been in terms of costs and benefits compared to façade insulation alone.

When the objective of fulfilling a new pollution regulation is being considered, a cost-effectiveness analysis (CEA), which is about finding the least costly way of meeting the regulatory limit, is often carried out. Measures more costly than the least costly are disregarded, even though the additional benefits may outweigh the added cost. Cost-benefit analysis (CBA), on the other hand, compares the various benefits of a measure to the costs [6]. In CBA, the measure with the highest ratio between benefits and costs will often be considered the most advantageous, regardless of whether it is relatively costly or not. When considering CEA vs CBA, it is relevant to point out that Norway has been moving towards a national target of noise annoyance reduction by 25 per cent before the year 2010. This reduction was to be accomplished mainly by addressing noise emissions at source. The target has since been reduced to 10 per cent reduction in noise annoyance, and the time limit for attaining the target pushed forward to 2020. Since road traffic noise is responsible for 80 per cent of noise-annoyance in Norway [7], and the main cause is road surface/tyre interaction, the authorities may need to find low-noise road surfaces that will survive winter conditions in the country [8].

*Economic Analysis of Transportation Noise Abatement* Jon P. Nelson, 1978      Comparative Environmental Economic Assessment R. J. G. M. Florax, Peter Nijkamp, Kenneth George Willis, 2002 Over the last decade economists have increasingly recognized the role of meta analysis and value transfer in synthesizing knowledge and efficiently exploiting the existing pool of knowledge *Comparative Environmental Economic Assessment* explores the potential significance of using these techniques particularly in environmental economics Both meta analysis and value transfer constitute major research tools which efficiently use knowledge previously acquired from other studies The book focuses on the potential role and usefulness of these tools in environmental economic research and goes on to address their validity relevance and applicability A future agenda for research is also illustrated      *Meta-Analysis in Environmental Economics* J.C. van den Bergh, Kenneth J. Button, Peter Nijkamp, G.C. Pepping, 2013-03-09 Meta analysis is a formal synthesis of results and findings of scientific studies which can assist in gaining new insights explaining differences between results of similar studies or determine useful directions of research In this book we focus on the use of meta analysis in environmental economics and related fields of study The first part of the book covers the overall meta approach methodology for social sciences and economics in particular This is followed by technical and non technical discussions of statistical and rough set techniques for analysis At appropriate places this is supplemented with reviews of applications in environmental economics and related fields In the second part of the book a number of case studies show different aspects of the application of meta analysis The research areas considered include among others tourism multipliers air pollution valuation risk and value of life pesticide price policy travel time savings and transport externality and policy issues The benefits of the appropriate application of meta analysis in environmental economics are a better use of existing information and knowledge removal of some of the subjectivity from analysis and forecasting and greater clarity as to where future efforts in environmental economic analysis can most gainfully be deployed      **Proposed Master Plan Update Development Actions, Seattle-Tacoma (Sea-Tac) International Airport, King County**, 1996      **Urban Transportation Economics** K.
