Sibel Erduran, Zoubeida R. Dagher, 2014-08-20 Prompted by the ongoing debate among science educators over nature of science and its importance in school and university curricula this book is a clarion call for a broad reconceptualizing of nature of science in science education The authors draw on the family resemblance approach popularized by Wittgenstein defining science as a cognitive epistemic and social institutional system whose heterogeneous characteristics and influences should be more thoroughly reflected in science education They seek wherever possible to clarify their developing thesis with visual tools that illustrate how their ideas can be practically applied in science education The volume's holistic representation of science which includes the aims and values knowledge practices techniques and methodological rules as well as science's social and institutional contexts mirrors its core aim to synthesize perspectives from the fields of philosophy of science and science education The authors believe that this more integrated conception of nature of science in science education is both innovative and beneficial They discuss in detail the implications for curriculum content pedagogy and learning outcomes deploy numerous real life examples and detail the links between their ideas and curriculum policy more generally

The Science of Education: Theoretical considerations Caleb Gattegno, 1985

Imagination of Science in Education Michiel van Eijck, Wolff-Michael Roth, 2012-10-10

Researchers agree that schools construct a particular image of science in which some characteristics are featured while others end up in oblivion. The result is that although most children are likely to be familiar with images of heroic scientists such as Einstein and Darwin they rarely learn about the messy day to day practice of science in which scientists are ordinary humans. Surprisingly the process by which this imagination of science in education occurs has rarely been theorized. This is all the more remarkable since great thinkers tend to agree that the formation of images imagination is at the root of how human beings modify their material world. Hence this process in school science is fundamental to the way in which scientists being the successful agents in of science education actually create their own scientific enterprise once they take up their professional life. One of the first to examine the topic this book takes a theoretical approach to understanding the process of imagining science in education. The authors utilize a number of interpretive studies in both science and science education to describe and contrast two opposing forces in the imagination of science in education epicization and novelization. Currently they argue the imagination of science in education is dominated by epicization which provides an absolute past of scientific heroes and peak discoveries. This opens a distance between students and today s scientific enterprises and contrasts sharply with the wider aim of science education to bring the actual world of science closer to students. To better understand how to reach this aim the authors offer a detailed look at novelization which is a continuous renewal of narratives that derives from dialogical interaction. The book brings together two hitherto separate fields of research in science education psychologically informed research on students images of science and semiotically informed research on images of science in textbooks. Drawing on a series of studies in which children participate in the imagination of science in and out of the classroom the authors show how the process of novelization actually occurs in the practice of education and outline the various images of science this process ultimately yields.

Progressing Science Education Keith S. Taber, 2009-05-29

Exploring one of the central themes in science education theory this volume examines how science education can be considered as a scientific activity within a broad post positivist notion of science. Many students find learning science extremely problematic whatever level of education they have reached. At the end of the 1970s a new approach to tackling learning difficulties in science was developed drawing on ideas from psychology and cognitive science and centred on the way students build up new knowledge in reference to their existing ideas. Constructivism became the dominant paradigm in science education research for two decades spawning a vast body of literature reporting aspects of learners ideas in different science topics. However Constructivism came under fire as it was recognised that the research did not offer immediate and simple prescriptions for effective science teaching. The whole approach was widely criticised in particular by those who saw it as having anti science leanings. In this book the notion of

scientific research programmes is used to understand the development limitations and potential of constructivism It is shown that constructivist work in science education fits into a coherent programme exploring the contingencies of learning science The author goes further to address criticisms of constructivism evaluate progress in the field and suggest directions for future research It is concluded that constructivism has provided the foundations for a progressive research programme that continues to guide enquiry into learning and teaching science

R. Jevons, 2022-06-01 First published in 1969 The Teaching of Science primarily deals with science teaching in secondary schools and universities but its searching discussion of criteria concerns all who have to do with education The concise but well documented treatments of the nature of the scientific process and of the social implications of science will be of interest to many scientists and especially useful for teachers of general studies Professor Jevons looks first at why we should teach science and thereby sheds light on the more immediately practical problems of how it should be done He thus does more than merely add to the already large volume of exhortation to make it more attractive and intellectually stimulating **Science | Environment | Health** Albert Zeyer, Regula Kyburz-Graber, 2012-05-24 Health and the environment are important learning areas in science education and their significance is growing Not only do they have high social relevance but they are also close to students interests and needs They provide many opportunities to unlock science with questions that are personally relevant to boys and girls and that inspire them to engage in science This book contains a selection of papers from prominent professionals in science health and environmental education who reflect on science education each from their specific point of view The core idea is to present well founded perspectives on how science education may benefit from challenges stemming from both health and environmental education Specific reasons are discussed as to why these two areas are particularly legitimized to challenge science education and their potential impact on a revision of science education is evaluated A new pedagogy for science environment health that yields interesting and relevant science education for students and teachers and addresses the grand challenges of this century what an attractive and rewarding project The book will motivate teachers teacher educators and science education researchers to take part in this on going project *Education Science* , 2009-01-01 Educational research is not what it was fifteen years ago In this discipline the changes have been dramatic far reaching and rapid Out of the criticisms of the 1990s and the calls for greater accountability of the early 2000s one idea has come to the fore education science There are two main components to education science The first is the principle that research in education must model itself more closely on disciplines seen as

highly credible and successful mainly the natural sciences and medicine The second part is that educators must build their practice upon the insights developed through this scientific research process Overall education science has the potential to change how we think about education how we build knowledge about it and how we know when it is successful This volume brings together some of the most active proponents of education science and some of the most committed critics Within it the idea of education science is explored in depth randomized controlled trials considered the gold standard of education science are discussed in detail and the philosophical difficulties of knowledge in education are explored Established thinkers are brought alongside newly emerging analysts and detailed accounts of the institutions driving education science are included Each contribution is thoughtful and balanced engaging with the issues of the field and how they might be addressed As a body of work this collection of essays provides a well rounded critical discussion of the potential and the problems of the education science movement
