## **Ecology A Textbook:**

*Ecology*, 1997      **Ecology, a textbook** Hermann Remmert, 1980 Table of contents A Ecology the basic concept B Autecology C Population ecology D Ecosystems E Outlook References General books on subjects related to ecology Subject Index      **Introductory Ecology** Peter Cotgreave, Irwin Forseth, 2009-04-01 In this age of increasing human domination of the Earth's biological and physical resources a basic understanding of ecology is more important than ever. Students need a textbook that introduces them to the basic principles of ecological science, one that is relevant to today's world and one that does not overwhelm them with detail and jargon. Peter Cotgreave and Irwin Forseth have designed this book to meet the needs of these students by providing a basic synthesis of how individual organisms interact with their physical environment and with each other to generate the complex ecosystems we see around us. The unifying theme of the book is biodiversity: its patterns, causes, and the growing worldwide threats to it. Basic ecological principles are illustrated using clearly described examples from the current ecological literature. This approach makes the book valuable to all students studying ecology. Examples have been chosen carefully to represent as wide a range of ecosystems, terrestrial and aquatic, northern and southern hemisphere, and life forms: animal, plant, and microbe as possible. Particular attention is paid to consequences of global change on organisms, populations, ecological communities, and ecosystems. The end result is a text that presents a readable and persuasive picture of how the Earth's natural systems function and how that functioning may change over the coming century. Features include strong coverage of applied and evolutionary ecology, applications of ecology to the real world, a question-orientated approach, the only comprehensive treatment of ecology written for the introductory student, an emphasis on definitions of key words and phrases, an integration of experimental, observational, and theoretical material, examples drawn from all over the world, and a wide variety of organisms. A logical structure builds from the response of individual organisms to physical factors through population growth and population interactions to community structure and ecosystem function. Suggested further reading lists for each chapter, boxes to explain key concepts in more depth, dedicated text sites featuring additional information and teaching aids: [www.blackwellpublishing.com/cotgreave](http://www.blackwellpublishing.com/cotgreave). Peter Cotgreave is an animal ecologist who has worked for the University of Oxford and the Zoological Society of London. His research interests centre on abundance and rarity within animal communities. Irwin Forseth is a plant physiological ecologist who has taught introductory ecology and plant ecology at the University of Maryland since 1982. His research focuses on plant responses to the environment. The authors have studied organisms as diverse as green plants, insects, and mammals in habitats from deserts to tropical rainforests. They have worked in ecological research and education in Africa, Asia, North and South America, Europe, and the Caribbean.      **Tropical Ecology** John C. Kricher, 2011-02-28 A comprehensive introduction to tropical ecology. This full color illustrated textbook offers the first comprehensive introduction to all major aspects of tropical ecology. It explains why the world's tropical rain forests are so universally rich in species, what factors may contribute to high

species richness how nutrient cycles affect rain forest ecology and how ecologists investigate the complex interrelationships among flora and fauna It covers tropical montane ecology riverine ecosystems savanna dry forest and more Tropical Ecology begins with a historical overview followed by a sweeping discussion of biogeography and evolution and then introduces students to the unique and complex structure of tropical rain forests Other topics include the processes that influence everything from species richness to rates of photosynthesis how global climate change may affect rain forest characteristics and function how fragmentation of ecosystems affects species richness and ecological processes human ecology in the tropics biodiversity and conservation of tropical ecosystems and species Drawing on real world examples taken from actual research Tropical Ecology is the best textbook on the subject for advanced undergraduates and graduate students Offers the first comprehensive introduction to tropical ecology Describes all the major kinds of tropical terrestrial ecosystems Explains species diversity evolutionary processes and coevolutionary interactions Features numerous color illustrations and examples from actual research Covers global warming deforestation reforestation fragmentation and conservation The essential textbook for advanced undergraduates and graduate students Suitable for courses with a field component Leading universities that have adopted this book include Biola University Bucknell University California State University Fullerton Colorado State University Fort Collins Francis Marion University Michigan State University Middlebury College Northern Kentucky University Ohio Wesleyan University St Mary's College of Maryland Syracuse University Tulane University University of California Santa Cruz University of Central Florida University of Cincinnati University of Florida University of Missouri University of New Mexico University of North Carolina at Chapel Hill University of the West Indies

Putman, 2012-12-06 As Ecology teachers ourselves we have become increasingly aware of the lack of a single comprehensive textbook of Ecology which we can recommend unreservedly to our students. While general review texts are readily available in other fields, recent publications in Ecology have tended for the most part to be small specialised works on single aspects of the subject. Such general texts as are available are often rather too detailed and in addition tend to be somewhat biased towards one aspect of the discipline or another and are thus not truly balanced syntheses of current knowledge. Ecology is in addition a rapidly developing subject: new information is being gathered all the time on a variety of key questions; new approaches and techniques open up whole new areas of research and establish new principles. Already things have changed radically since the early 70s and we feel there is a need for an up to date student text that will include some of this newer material. We have tried therefore to create a text that will review all the major principles and tenets within the whole field of Ecology, presenting the generally accepted theories and fundamentals and reviewing carefully the evidence on which such principles have been founded. While recent developments in ecological thought are emphasised we hope that these will not dominate the material to the extent where the older established principles are ignored or overlooked.
