

Exercise

1. In Fig. 17.3, let y be at the distance $r\sqrt{2}$ from the center of the circle C of radius r . As we trace the outer arc of C from one point of tangency to the other, through what angle does the ray L_y turn? Through what angle does it turn as we continue around the circle along the inner arc?
2. The complement in P of the closed curve in Fig. 17.3 consists of seven connected regions labeled A, B, C, D, E, F, G . For each region, state the winding number of the closed curve about a point of that region.
3. Do the same as in the preceding problem for the closed curve of Fig. 17.5.

Figure 17.3

Figure 17.5

18. Statement of the main theorem

By using the concept of winding number, we can formulate now the main theorem of Part II.

THEOREM 18.1. Let $f: D \rightarrow P$ be a mapping of a disk into the plane, let C be the boundary circle of D , and let y be a point of the plane not on $f(C)$. If the winding number of $f(C)$ about y is not zero, then $y \in f(D)$ (i.e. there is a point $x \in D$ such that $fx = y$).

What follows is a short intuitive proof. Let r be the radius of C . For each number s such that $0 \leq s \leq r$, let C_s be the circle of radius s concentric with C ; thus $C_r = C$, and C_0 is the center point a . Let y' be a point of the plane not in $f(D)$. Then for every s in $[0, r]$, y' is not on $f(C_s)$ because C_s is in D , and so the winding number $W(f(C_s), y')$ is defined for every s in $[0, r]$. Abbreviate it by $W(s)$. Consider now the family of closed curves $f(C_s)$ as s decreases from r to 0. Its members begin with $f(C)$ and eventually shrink down to the constant curve $f(C_0)$ (i.e. to the point fa). Since $f(C_s)$ varies gradually as s decreases steadily, it follows that $W(s)$ is a continuous function of $s \in [0, r]$.

How does the winding number $W(s)$ vary? The answer is not at all, because W is a continuous function of s and each value $W(s)$ must be an integer; it cannot jump from one integer value to another without taking on non-integer values between (see the main theorem of Part I). Thus $W(s)$ has the same value for all s ; in particular, $W(r) = W(0)$. But $W(0) = 0$ because $f(C_0) = fa$ is the constant closed curve. Therefore $f(C)$ has winding number zero about y' for every point y' not in $f(D)$. It follows that $W(f(C), y) \neq 0$ implies that y is in $f(D)$, and to say that y is in $f(D)$ is to say that there is an $x \in D$ such that $fx = y$.

One can see how the argument works in the illustration of Fig. 18.1 by following the successive closed curves $f(C_s)$ as s decreases; as soon as the two lobes separate (e.g., the third closed curve drawn), y is clearly in the exterior of this closed curve, and therefore the winding number is zero. Notice that this agrees with the result obtained for Fig. 17.5.

Figure 18.1

Exercise

1. If the closed curve in Exercise 1 of Section 17 is the $f(C)$ of a map $f: D \rightarrow P$, which of the complementary regions $A, B, \dots$ must lie in $f(D)$?
2. Answer the analogous question for the closed curve of Exercise 3, Section 17.
3. Let $f: P \rightarrow P$ be a mapping of the plane into itself that is a simple fold along a diameter of a disk.
 - (a) What is the image of the boundary circle C of the disk?
 - (b) What is the winding number $W(f(C), y)$ of points y in the image of the disk?
