Rumelhart,Stephen P. Stich,2013-06-17 The philosophy of cognitive science has recently become one of the most exciting and fastest growing domains of philosophical inquiry and analysis Until the early 1980s nearly all of the models developed treated cognitive processes like problem solving language comprehension memory and higher visual processing as rule governed symbol manipulation However this situation has changed dramatically over the last half dozen years In that period there has been an enormous shift of attention toward connectionist models of cognition that are inspired by the network like architecture of the brain Because of their unique architecture and style of processing connectionist systems are generally regarded as radically different from the more traditional symbol manipulation models This collection was designed to provide philosophers who have been working in the area of cognitive science with a forum for expressing their views on these recent developments Because the symbol manipulating paradigm has been so important to the work of contemporary philosophers many have watched the emergence of connectionism with considerable interest The contributors take very different stands toward connectionism but all agree that the potential exists for a radical shift in the way many philosophers think of various aspects of cognition Exploring this potential and other philosophical dimensions of connectionist research is the aim of this volume

Mechanical Bodies, Computational Minds Stefano Franchi,Güven Güzeldere,2005 Researchers in artificial intelligence and scholars in the humanities consider the past present and future of artificial intelligence from a multidisciplinary perspective *The Economics of Attention* Richard A. Lanham,2006-04-21 If economics is about the allocation of resources then what is the most precious resource in our new information economy Certainly not information for we are drowning in it No what we are short of is the attention to make sense of that information With all the verve and erudition that have established his earlier books as classics Richard A Lanham here traces our epochal move from an economy of things and objects to an economy of attention According to Lanham the central commodity in our new age of information is not stuff but

style for style is what competes for our attention amidst the din and deluge of new media In such a world intellectual property will become more central to the economy than real property while the arts and letters will grow to be more crucial than engineering the physical sciences and indeed economics as conventionally practiced For Lanham the arts and letters are the disciplines that study how human attention is allocated and how cultural capital is created and traded In an economy of attention style and substance change places The new attention economy therefore will anoint a new set of moguls in the business world not the CEOs or fund managers of yesteryear but new masters of attention with a grounding in the humanities and liberal arts Lanham s The Electronic Word was one of the earliest and most influential books on new electronic culture The Economics of Attention builds on the best insights of that seminal book to map the new frontier that information technologies have created   **The New Writing Environment** Mike Sharples,Thea van der Geest,2012-12-06 Information technology is changing the way we write Special features such as outliners spelling checkers and graphic facilities have transformed word processors into document processors document processors have in turn integrated with other electronic resources such as e mail and the Internet to provide a complete writing environment The New Writing Environment examines the knowledge that is needed in order to develop use and evaluate computer based writing environments The emphasis is firmly on practical issues tasks performed by writers at work problems they encounter and documents they actually produce Writing is defined within a wide social and organisational context in order to give an accurate assessment of how the new technology affects the social and cooperative aspects of authorship The result is a wide ranging and comprehensive assessment of the relationship between writing and computers   **Changing Mind** Franco Orsucci,2002 This book applies complexity theory to cognitive science and the result is a transformation of this field It proposes a biophysical theory of human relations attempting to expand all its implications for research and theory It presents the potential clinical applications of this theory in neuroscience and clinical psychology OCo a general theory of mind change

Moor,2012-12-06 In 1950 Alan Turing 1912 1954 published his famous article Computing Machinery and Intelligence in the journal Mind This article is arguably the most influential and widely read article in the philosophy of artificial intelligence Indeed most of the debate in the philosophy of artificial intelligence over the last fifty years concerns issues that were raised and discussed by Turing Turing s genius was not only in developing the theory of computability but also in understanding the impact both practical and philosophical that computing machinery would have Turing believed that computers if properly designed and educated could exhibit intelligent behavior even behavior that would be indistinguishable from human intelligent behavior His vision of the possibility of machine intelligence has been highly inspiring and extremely controversial In this classic article Turing presented his well known imitation game and predicted that about the year 2000 an average interrogator will not have more than 70 per cent chance of making the right identification after five minutes of questioning in the imitation game Based on the results of the Loebner 2000 contest and the accomplishments in the field of AI as impressive as they are Turing s prediction remains unfulfilled *Season of Ash* Jorge Volpi Escalante,2009 The Soviet
