Risk profile - Group B

Streptococcus (GBS) -? Streptococcus agalactiae sequence type (ST) 283 in freshwater fish Food and Agriculture Organization of the United Nations,2021-06-11 In Singapore during 2015 Group B Streptococcus GBS sequence type 283 ST283 caused the only reported foodborne outbreak of invasive GBS disease Over 20 percent of cases were healthy adults without comorbidities which is unusual for GBS The outbreak was linked to the consumption of raw freshwater fish Subsequent investigations found that ST283 GBS has been common among GBS causing disease in humans and in tilapia across Southeast Asia for at least 20 years whereas it was almost non existent outside this region Given the novelty of the outbreak this risk profile consolidates the current knowledge to identify data gaps about GBS ST283 along the freshwater fish supply chain in Southeast Asia Although GBS fish infection can present with few clinical signs of disease outbreaks of GBS in high intensity tilapia aquaculture can result in severe infection with mortalities of up to 80 percent These outbreaks are largely undocumented but likely have a wide effect on aquaculture given its economic and social importance across Southeast Asia There is also a lack of data on patterns of fish consumption including frequency amount preparation and consumer demographics Nevertheless consumption of non heat treated freshwater fish is common in Southeast Asia Given the multitude of data gaps the risk posed by GBS ST283 from consumption of freshwater fish remains highly uncertain Potential risk management options start with the application of good aquaculture practices and good food safety measures throughout the supply chain

Digenetic Trematodes Rafael Toledo,Bernard Fried,2024-07-15 Although digenetic

trematodes have been largely neglected they constitute a major group of helminths that parasitize human and animals causing significant morbidity and mortality This is of special importance today since the geographical limits and the populations at risk traditionally limited to developing or low income countries are currently expanding and changing in relation to factors such as growing international markets improved transportation systems and demographic changes This has led to a growing international interest in trematode infections although factors such as the difficulties entailed in the diagnosis the complexity of human and agricultural practices the lack of assessments of economic costs or the limited number of effective drugs are preventing the development of control measures of these diseases in humans and livestock In depth studies are needed to clarify the current epidemiology of these helminth infections and to identify new and specific targets for both effective diagnosis and treatments The main goal of the third edition of this book is to present the major trematodes and their corresponding diseases in the framework of modern parasitology considering matters such as the application of novel techniques and analysis of data in the context of host parasite interactions and also with the resident microbiota showing the application of modern techniques and concepts to the studies on digenetic trematodes This is an ideal book for parasitologists microbiologists zoologists immunologists public health professionals clinicians and graduate and post graduate students
