## **Emerging Applications Of Number Theory:**

*Emerging Applications of Number Theory* Dennis A. Hejhal, 1999-05-21 Most people tend to view number theory as the very paradigm of pure mathematics. With the advent of computers, however, number theory has been finding an increasing number of applications in practical settings such as in cryptography, random number generation, coding theory, and even concert hall acoustics. Yet other applications are still emerging, providing number theorists with some major new areas of opportunity. The 1996 IMA summer program on Emerging Applications of Number Theory was aimed at stimulating further work with some of these newest and most attractive applications. Concentration was on number theory's recent links with wave phenomena in quantum mechanics, more specifically quantum chaos, and graph theory, especially expander graphs and related spectral theory. This volume contains the contributed papers from that meeting and will be of interest to anyone intrigued by novel applications of modern number theoretical techniques.

**Unusual Applications of Number Theory** Melvyn Bernard Nathanson, 2004 This volume contains the proceedings of the workshop held at the DIMACS Center of Rutgers University, Piscataway, NJ, on Unusual Applications of Number Theory. Standard applications of number theory are to computer science and cryptology. In this volume, well-known number theorist Melvyn B. Nathanson gathers articles from the workshop on other, less standard applications in number theory, as well as topics in number theory with potential applications in science and engineering. The material is suitable for graduate students and researchers interested in number theory and its applications.

*Automorphic Forms and Applications* Peter Sarnak, Freydoon Shahidi, 2007 The theory of automorphic forms has seen dramatic developments in recent years. In particular, important instances of Langlands functoriality have been established. This volume presents three weeks of lectures from the IAS Park City Mathematics Institute Summer School on automorphic forms and their applications. It addresses some of the general aspects of automorphic forms, as well as certain recent advances in the field. The book starts with the lectures of Borel on the basic theory of automorphic forms, which lay the foundation for the lectures by Cogdell and Shahidi on converse theorems, and the Langlands-Shahidi method, as well as those

by Clozel and Li on the Ramanujan conjectures and graphs The analytic theory of GL 2 forms and L functions are the subject of Michel s lectures while Terras covers arithmetic quantum chaos The volume also includes a chapter by Vogan on isolated unitary representations which is related to the lectures by Clozel This volume is recommended for independent study or an advanced topics course It is suitable for graduate students and researchers interested in automorphic forms and number theory the Institute for Advanced Study Park City Mathematics Institute Members of the Mathematical Association of America MAA and the National Council of Teachers of Mathematics NCTM receive a 20% discount from list price

*Zeta Functions of Graphs* Audrey Terras, 2010-11-18 Graph theory meets number theory in this stimulating book Ihara zeta functions of finite graphs are reciprocals of polynomials sometimes in several variables Analogies abound with number theoretic functions such as Riemann Dedekind zeta functions For example there is a Riemann hypothesis which may be false and prime number theorem for graphs Explicit constructions of graph coverings use Galois theory to generalize Cayley and Schreier graphs Then non isomorphic simple graphs with the same zeta are produced showing you cannot hear the shape of a graph The spectra of matrices such as the adjacency and edge adjacency matrices of a graph are essential to the plot of this book which makes connections with quantum chaos and random matrix theory plus expander Ramanujan graphs of interest in computer science Created for beginning graduate students the book will also appeal to researchers Many well chosen illustrations and exercises both theoretical and computer based are included throughout

Spectral Problems in Geometry and Arithmetic Thomas Branson, 1999

These are the proceedings of the NSF CBMS Conference on Spectral Problems in Geometry and Arithmetic held at the University of Iowa The principal speaker was Peter Sarnak who has been a central contributor to developments in this field The volume approaches the topic from the geometric physical and number theoretic points of view The remarkable new connections among seemingly disparate mathematical and scientific disciplines have surprised even veterans of the physical mathematics renaissance forged by gauge theory in the 1970s Numerical experiments show that the local spacing between zeros of the Riemann zeta function is modelled by spectral phenomena the eigenvalue distributions of random matrix theory in particular the Gaussian unitary ensemble GUE Related phenomena are from the point of view of differential geometry and global harmonic analysis Elliptic operators on manifolds have through zeta function regularization functional determinants which are related to functional integrals in quantum theory The search for critical points of this determinant brings about extremely subtle and delicate sharp inequalities of exponential type This indicates that zeta functions are spectral objects and even physical objects This volume demonstrates that zeta functions are also dynamic chaotic and more

**Dynamical, Spectral, and Arithmetic Zeta Functions** Michel Laurent Lapidus, Machiel Van

Frankenhuysen,2001 The original zeta function was studied by Riemann as part of his investigation of the distribution of prime numbers Other sorts of zeta functions were defined for number theoretic purposes such as the study of primes in arithmetic progressions This led to the development of L functions which now have several guises It eventually became clear that the basic construction used for number theoretic zeta functions can also be used in other settings such as dynamics geometry and spectral theory with remarkable results This volume grew out of the special session on dynamical spectral and arithmetic zeta functions held at the annual meeting of the American Mathematical Society in San Antonio but also includes four articles that were invited to be part of the collection The purpose of the meeting was to bring together leading researchers to find links and analogies between their fields and to explore new methods The papers discuss dynamical systems spectral geometry on hyperbolic manifolds trace formulas in geometry and in arithmetic as well as computational work on the Riemann zeta function Each article employs techniques of zeta functions The book unifies the application of these techniques in spectral geometry fractal geometry and number theory It is a comprehensive volume offering up to date research It should be useful to both graduate students and confirmed researchers **Mathematical Approaches for**
