Estimating beta and Cost of Equity Capital for Non-traded Transportation Companies Sascha Heller,2014-04-11

Inhaltsangabe Introduction Estimating the cost of equity capital has two major implications First it reflects the return to a company's stock which an equity investor expects to receive from his investment He makes his decision upon whether he could earn a higher rate of return in an alternative investment of equivalent risk Second a company must earn the cost of capital both debt and equity through its undertaken projects It is hence relevant for decisions on undertaking positive net present value projects which are of similar risk as the company's average business activities It also substantially influences the pricing of an entire firm as far as the valuation is based on a discounted cash flow model A lot of effort has been done in the past to achieve accurate models which precisely determine this cost Building on the modern portfolio theory of Harry Markowitz a widely used and commonly known model in this context is the Capital Asset Pricing Model CAPM Introduced by several researchers in the 1960s it is still one of the most applied methods for practitioners However it suffers from several shortcomings including statistical caveats economic assumptions the absence of market frictions and the behaviour of market participants An upgrade to this model was provided by Stephen Ross which has resulted in the Arbitrage Pricing Theory APT It combines several risk factors in addition to one market proxy as it is the case in the CAPM and is less restrictive in its assumptions But both CAPM and APT require observable market data i.e. stock prices of the analysed companies These models thus only work for publicly listed firms If research should be done on non-traded companies however an alternative methodology must be applied In general data from the balance sheet the income statement and the cash flow statement are available for both listed and non-listed companies While accounting data have widely been used in the past as well and have been assumed to provide valuable information in explaining stock returns this line of research has dissipated over time Only a few key figures such as size and financial leverage are still considered to be relevant However they can be used to indirectly estimate a firm's beta by assessing their explanatory power in a CAPM or APT framework This methodology is particularly beneficial for firms which are not listed because there cannot be observed any stock price movements

### **Trading on Expectations**

Brendan Moynihan,1997-04-29 Successful traders know that before stepping into the wilderness ofthe speculative markets you need a solid understanding of basicmarket behavior But the conventional methods often fall short ofproviding this basic knowledge Academics assert one thing economists and fundamental analysts another and technicians something altogether different And seemingly none of them agree with each other Trading on Expectations explores the ideas behind the dominant schools of analysis and shows the validity of each and demonstrates how each albeit at different times reflects what the market is doing Sometimes market prices can be predicted using the economists models sometimes prices follow a random walk as the academics claim at other times price is responding to the patterns trendlines and breakout levels identified by technicians In this groundbreaking new book Brendan Moynihan draws on his experience as a trader analyst and researcher to develop a method that focuses on the prime mover of prices and incorporates the strengths of the conventional methods Drawing on the participant focused Chicago Board of Trade Market Profile and the psychologically focused Contrary Opinion he synthesizes and modifies the best in these different methods and skillfully creates a single model of market behavior the Sentiment Activity Model Moynihan carefully describes how the combination of participants actions and

expectations about the future determines the direction of prices in the markets. This dynamic interaction between actions and expectations explains the emergence of the dominant phases of the markets: price trends, trading ranges, and trend reversals. What's more, Moynihan's unique model enables you to pinpoint the combinations of activity and sentiment that determine the three states of the market as they unfold in time frames ranging from a single day to several weeks or months. The Sentiment Activity Model also provides a way to determine how the market is likely to respond to various news items, explaining the apparent anomalies of price behavior in the process. To document his findings, Moynihan provides illuminating applications over a multi-month time period to four markets: Treasury bonds, soybeans, deutsche marks, and crude oil. Offering a new, more powerful way of understanding the dynamics of market behavior, *Trading on Expectations* is a must read for all traders in stocks, options, and futures. Brendan Moynihan has studied the real economists and found the truth about how human action and individual motivations determine market prices. *Trading on Expectations* combines the best of the traders' economic and technical tools. I recommend this book to anyone who wants to learn how to trade more successfully. Brian S. Wesbury, Chief Economist, Griffin Kubik, Stephens Thompson, and former chief economist, Joint Economic Committee of the United States Congress. In today's fast-forward society, readers of this book can quickly absorb the real essence of Trading Reality that takes years to understand. In fact, many traders have come and gone without realizing how successful traders operate. It could take years together the perspectives of this book. The Hightower Report plans to use the book for training its analysts. David C. Hightower, Editor, The Hightower Report. Where most market texts simply reheat and serve the same old approaches, *Trading on Expectations* offers a fresh perspective by combining the best of several market disciplines into a logical theory and workable system for trading all financial markets. Michael Zentz, Director of Fixed Income Research, Pegasus Econometric Group.
