

dose to low-dose extrapolation, particularly in the current use of the linear no-threshold model for cancer induction. We also call for research related to the improvement of exposure- and dose-assessment models through validation of parameters, for better standardization of measurement methods for TENORM, for better understanding of the effects of the chemical form and physical structure of TENORM on dose, and for greater insight into and documentation of the various uses and dispersal of TENORM.

3. The ALARA (as low as reasonably achievable) objective is the most important factor in guiding agency actions aimed at radiation protection—much more important than established regulatory limits or goals. To the extent that the ALARA objective is applied consistently to all exposure situations, all guidances and regulations would be consistent, provided that it is recognized that risks that are ALARA can vary considerably with the particular exposure situation.

CONTEXT FOR REGULATION OF TENORM

1. All natural media—earth, air, and water—and biota, including humans, contain naturally occurring radionuclides to some degree. Annual doses received by residents of the United States from all sources of natural radiation in the environment average about 3 mSv and are quite variable—estimated to range over a factor of about 4 for external sources and 20 for radon.

2. TENORM can be formed whenever NORM are moved from inaccessible locations to sites where there is a greater possibility of human exposure and whenever human activities process earth materials in a way that concentrates NORM. TENORM radionuclide concentrations and volumes vary greatly because of the diversity of sites, materials, and processes and because of the substantial variations in leachability, sorption, and biologic availability. Increases in radiation exposure from TENORM sources are typically local, rather than global, concerns.

RISK ASSESSMENT ISSUES UNDERLYING TENORM REGULATION

1. The committee notes that for radiation sources related to TENORM, including indoor radon, all regulatory and advisory groups have assumed about the same risk coefficients. This reflects a general acceptance by the scientific community of the linear no-threshold risk-extrapolation approach as a plausible and useful means of developing public-health regulations. The committee does
