Pagano, 2022-10-27 In order to feed the world global agriculture will have to double food production by 2050 As a result the use of soils with fertilizers and pesticides in agronomic ecosystems will increase taking into account the sustainability of these systems and also the provision of food security Thus soil ecosystems their health and their quality are directly involved in sustainable agronomical practices and it is important to recognize the important role of soil microbial communities such as mycorrhizal fungi their biodiversity interactions and functioning Soil ecosystems are under the threat of biodiversity loss due to an increase of cultivated areas and agronomic exploitation intensity Also changes in land use alter the structure and function of ecosystems where biodiversity is vital in the ecosystem Soils are a major aid in food production in all terrestrial ecosystems however this means they are also involved in gas emission and global warming Thus in agronomic ecosystems several mitigation practices have been proposed to promote the increase of carbon soil stock and the reduction of warming gas emission from soils In South America most of the rural population depends economically on agriculture and usually works in family units New organic safe and sustainable agro forestry practices must be applied to support local communities and countries to achieve hunger eradication rural poverty reduction and sustainable development This book compiles new information for mycorrhizal occurrence in natural and anthropic environments in South America It includes new reports of
