The January 17, 1995 Hyōgo-ken-Nanbu (Kobe) Earthquake, 1996 [The Hanshin-Awaji Earthquake of January 17, 1995](#)
Donald B. Ballantyne, National Center for Earthquake Engineering Research (U.S.), 1995 **Handbook Of Disaster Risk Reduction & Management: Climate Change And Natural Disasters** Christian N Madu, 2017-07-25 Climate change is increasingly of great concern to the world community The earth has witnessed the buildup of greenhouse gases GHG in the atmosphere changes in biodiversity and more occurrences of natural disasters Recently scientists have begun to shift their emphasis away from curbing carbon dioxide emission to adapting to carbon dioxide emission The increase in natural disasters around the world is unprecedented in earth s history and these disasters are often associated to climate changes Many nations along the coastal lines are threatened by massive floods and tsunamis Earthquakes are increasing in intensity and erosion and droughts are problems in many parts of the developing countries This book is therefore to investigate ways to prepare and effectively manage these disasters and possibly reduce their impacts The focus is on mitigation strategies and policies that will help to reduce the impacts of natural disasters The book takes an in depth look at climate change and its association to socio economic development and cultures especially in vulnerable communities and investigates how communities can develop resilience to disasters A balanced and a multiple perspective approach to manage the risks associated with natural disasters is offered by engaging authors from the entire globe to proffer solutions [SYNER-G: Typology Definition and Fragility Functions for Physical Elements at Seismic Risk](#) K. Pitilakis, H. Crowley, A.M. Kaynia, 2014-01-20 Fragility functions constitute an emerging tool for the probabilistic seismic risk assessment of buildings infrastructures and lifeline systems The work presented in this book is a partial product of a European Union funded research project SYNER G FP7 Theme 6 Environment where existing knowledge has been reviewed in order to extract the most appropriate fragility functions for the vulnerability analysis and loss estimation of the majority of structures and civil works exposed to earthquake hazard Results of other relevant European projects and international initiatives are also incorporated in the book In several cases new fragility and vulnerability functions have been developed in order to better represent the specific characteristics of European elements at risk Several European and non European institutes and Universities collaborated efficiently to capitalize upon existing knowledge State of the art methods are described existing fragility curves are reviewed and where necessary new ones are proposed for buildings lifelines transportation infrastructures as well as for utilities and critical facilities Taxonomy and typology definitions are synthesized and the treatment of related uncertainties is discussed A fragility function manager tool and fragility functions in electronic form are provided on extras springer com Audience The book aims to be a standard reference on the fragility functions to be used for the seismic vulnerability and probabilistic risk assessment of the most important elements at risk It is of particular interest to earthquake engineers scientists and researchers working in the field of earthquake risk assessment as well as the insurance

industry civil protection and emergency management agencies

Assessing and Managing Earthquake Risk Carlos Sousa Oliveira, Antoni Roca, Xavier Goula, 2007-12-04 Table 1 1 reports the world's largest earthquakes since 1900 with respect to number of deaths larger than or equal to 10 000 also showing the region of occurrence and the corresponding magnitudes Both from Figure 1 2 and Table 1 1 it is interesting to note that this period of time is characterized by an annual average of 15 000 deaths with two main fluctuations modal values the largest in the period 1900 to 1940 and another with a larger value in the decade of 1970 80 Figure 1 2 shows the number of total deaths from the greatest earthquakes that occurred in the XX century Although the number of victims has a tendency to decrease with time the economic losses are increasing significantly see Chapter 18 of this book Table 1 1 World earthquakes since 1900 with number of deaths greater than 10 000

Seismic Evaluation and Rehabilitation of Critical Components of Electrical Power Systems Selahattin Ersoy,2008

Modeling of Seismic Wave Scattering on Pile Groups and Caissons Ignatius Po Lam,Hubert Law,Chien Tai Yang,2007 This report documents practical modeling procedures adopted in the bridge engineering community involving seismic designs and retrofits of long span bridges relative to treatment of wave propagation problems It also discusses wave scattering issues arising from irregular foundation boundaries affecting seismic loading of the bridges which is not explicitly considered in the current design practice Wave scattering is generally implemented in the nuclear power plant industry for seismic designs of various containment systems often using frequency domain computer programs To examine the subject of wave scattering for application to long span bridge foundations systematic modeling is exercised using a time domain based computer program and verification is made against a frequency domain computer program For present day seismic designs of major bridges nonlinear time history analysis is a common procedure to examine seismic loading of the structure permitting plastic hinging and ductility to be implemented Thus the current trend is to adopt time domain based computer programs for performing wave scattering analyses which can also serve as a common platform to be used by both geotechnical and structural engineers for the global bridge model A major benefit is to minimize the amount of work for data transfer and potential error arising from two different groups geotechnical and structural engineers working on different computer codes requiring different input output By using the same computer code by both geotechnical and structural engineers many problems are eliminated Typically wave scattering analyses are conducted in the frequency domain This report presents studies of wave scattering using a time domain computer program The same computer program can be used by structural engineers to proceed with coding the superstructure model directly using the results from the wave scatterings analysis The report presents various sensitivity analyses in order to minimize wave reflection and refraction at the model's side boundaries Numerical integration schemes and implementation of Rayleigh parameters are discussed Careful examination of waves traveling the bottom boundary allows proper modeling of the half space below the region of interest The studies explore the effects from wave scattering on large pile groups and soft ground conditions and findings on the frequency ranges where significant scattering is observed are reported Large caissons are known to affect seismic wave scattering due to the large wave length implied by the dimensions of the foundation embedded in soil Parametric studies are performed to examine the shaking level that is altered by the wave scattering mechanism From the current findings it appears that the wave scattering tends to reduce the shaking level especially in the high frequency range and hence is beneficial to the bridge design

Enhancements to Hospital Resiliency Daniel Baldwin Hess,Lucy A. Arendt,2009 *Three-dimensional Modeling of Inelastic Buckling in Frame Structures* Macarena Schachter,Andrei M. Reinhorn,2007 Inelastic buckling is the most important failure mode of a steel beam column element subjected to compression force In order to correctly predict this phenomenon large rotations large displacements and the plasticity of the section along the element must be considered Several formulations have been proposed to model problems with three dimensional large displacements and rigid body dynamics They are usually based in the Lagrangian or the Corotational methods and are primarily oriented to solve mechanical and aerospace problems although some applications to structural stability do exist Independently several formulations have been developed to model plasticity fiber elements plastic flow theory and lumped plasticity are popular choices In this dissertation a novel formulation capable of solving problems with displacement and material nonlinearities in a unified way is developed Thus the State Space approach is selected because all the basic equations of structures equilibrium compatibility and plasticity are solved simultaneously and thus the global and local states are mutually and explicitly dependent To incorporate geometric nonlinearities the Corotational approach where rigid body motion and deformations are described separately is adopted To incorporate material nonlinearities the formulation developed by Simeonov 1999 and Sivaselvan 2003 is included In general the set of equilibrium compatibility and plasticity equations constitute a system of Differential Algebraic Equations DAE A procedure to solve such system exists and is implemented in the package IDA Implicit Differential Algebraic solver developed at the Lawrence Livermore National Laboratory LLNL which is used to solve the problem numerically An experimental study on zipper frames was conducted to assess the accuracy of the proposed formulation A zipper frame is a chevron braced frame where the beam to brace connections are linked through columns called zipper columns The failure mode of a zipper frame is the successive inelastic buckling of its braces Three shake table tests of a three stories zipper frame were performed at the UB NEES laboratory A model of the first story of the zipper frame was analyzed with the new formulation and its results compared to experimental data It is found that the new formulation can reproduce the features of the test and it is very sensitive to all the model parameters Results are presented
