Individual differences in associative learning Robin A. Murphy, Rachel M. Msetfi, 2014-09-24 Theories of associative learning have a long history in advancing the psychological account of behavior via cognitive representation There are many components and variations of associative theory but at the core is the idea that links or connections between stimuli or responses describe important aspects of our psychological experience This Frontiers Topic considers how variations in association formation can be used to account for differences between people elaborating the differences between males and females differences over the life span understanding of psychopathologies or even across cultural contexts A recent volume on the application of learning theory to clinical psychology is one example of this emerging application e.g. Hazelgrove Hogarth 2012 The task for students of learning has been the development often with mathematically defined explanations of the parameters and operators that determine the formation and strengths of associations The ultimate goal is to explain how the acquired representations influence future behavior This approach has recently been influential in the field of neuroscience where one such learning operator the error correction principle has

unified the understanding of the conditions which facilitate neuron activation with the computational goals of the brain with properties of learning algorithms e.g. Rescorla-Wagner 1972. In this Frontiers Research Topic we are interested in a similar but currently developing aspect to learning theory which is the application of the associative model to our understanding of individual differences including psychopathology. In general, learning theories are monolithic: the same theory applies to the rat and the human and within people the same algorithm is applied to all individuals. If so, this might be thought to suggest that there is little that learning theory can tell us about how males and females differ, how we change over time, or why someone develops schizophrenia, for instance. However, these theories have wide scope for developing our understanding of when learning occurs and when it is interfered with, along with a variety of methods of predicting these differences. We received contributions from researchers studying individual differences including sex differences, age-related changes, and those using analog or clinical samples of personality and psychopathological disorders where the outcomes of the research bear directly on theories of associative learning. This Research Topic brings together researchers studying basic learning and conditioning processes but in which the basic emotional, attentional, pathological, or more general physiological differences between groups of people are modeled using associative theory. This work involves varying stimulus properties and temporal relations or modeling the differences between groups.

**Introduction to Geometry of Manifolds with Symmetry** V.V. Trofimov, 2013-04-17. One of the most important features of the development of physical and mathematical sciences in the beginning of the 20th century was the demolition of prevailing views of the three-dimensional Euclidean space as the only possible mathematical description of real physical space. Apriorization of geometrical notions and identification of physical 3-space with its mathematical model were characteristic for these views. The discovery of non-Euclidean geometries led mathematicians to the understanding that Euclidean geometry is nothing more than one of many logically admissible geometrical systems. Relativity theory amended our understanding of the problem of space by amalgamating space and time into an integral four-dimensional manifold. One of the most important problems lying at the crossroad of natural sciences and philosophy is the problem of the structure of the world as a whole. There are a lot of possibilities for the topology of four-dimensional space-time, and at first sight a lot of possibilities arise in cosmology. In principle, not only can the global topology of the universe be complicated but also smaller-scale topological structures can be very nontrivial. One can imagine two usual spaces connected with a throat, making the topology of the union complicated.

**Infinite Powers** Steven Strogatz, 2019. This is the captivating story of mathematics' greatest ever idea: calculus. Without it, there would be no computers, no microwave ovens, no GPS, and no space travel. But before it gave modern man almost infinite powers, calculus was behind centuries of controversy, competition, and even death.

Taking us on a thrilling journey through three millennia professor Steven Strogatz charts the development of this seminal achievement from the days of Aristotle to today's million dollar reward that awaits whoever cracks Riemann's hypothesis. Filled with idiosyncratic characters from Pythagoras to Euler, *Infinite Powers* is a compelling human drama that reveals the legacy of calculus on nearly every aspect of modern civilization including science, politics, ethics, philosophy, and much besides.
