**Neuroethology** Jorg-Peter Ewert,2012-12-06 This volume presents the proceedings of the NATO Advanced Study Institute on Advances in Vertebrate Neuroethology held at the University of Kassel Federal Republic of Germany in August 1981

During the last decade much progress has been made in understanding the neurophysiological bases of behavior in both vertebrates and invertebrates The reason for this is that a number of new physiological anatomical and histochemical techniques have recently been developed for brain research which can now be combined with ethological methods for the analysis of animal behavior to form a new field of research known as Neuroethology The term Neuroethology was originally introduced by S L Brown and R W Hunsperger 1963 in connection with studies on the activation of agonistic behaviors by electrical brain stimulation in cats Neuroethology was more closely defined by G Hoyle 1970 in the context of a review on cellular mechanisms underlying behavior of invertebrates Since the 6th annual meeting of the Society for Neuroscience held in Toronto in 1976 Neuroethology has become established as a session topic      *The Noblest Animate Motion* Jeffrey Wollock,1997-11-11 The body of theory on speech production and speech disorder developed prior to Descartes has been so neglected by historians that its very existence is practically unknown today Yet it provides a framework for understanding the speech process which is not only comprehensive and coherent but of great relevance to current debates on issues of language performance and applied linguistics Current theoretical difficulties stem largely from initial errors of Descartes whereas earlier theoretical formulations while outlining a bio mechanics of speech retain the central role of the human agent The discussions explicated in this book come mainly from the natural philosophic and medical literature of Greco Roman Antiquity the Middle Ages and the Renaissance and early 17th century This uncharted territory is mapped by tracing its textual history and diffusion as well as explaining the theory on its own terms but in clear and comprehensible language Interdisciplinary in perspective the book encompasses topics of interest not only to the language sciences but also to the biosciences medicine philosophy of human movement psychology and behavioral sciences neurosciences speech pathology experimental phonetics speech and rhetoric and the history of science in general      **Pitch Determination of Speech**

**Signals** W. Hess,2012-12-06 Pitch i e fundamental frequency FO and fundamental period TO occupies a key position in the acoustic speech signal The prosodic information of an utterance is predominantly determined by this parameter The ear is more sensitive to changes of fundamental frequency than to changes of other speech signal parameters by an order of magnitude The quality of vocoded speech is essentially influenced by the quality and faultlessness of the pitch measure ment Hence the importance of this parameter necessitates using good and reliable measurement methods At first glance the task looks simple one just has to detect the funda mental frequency or period of a quasi periodic signal For a number of reasons

however the task of pitch determination has to be counted among the most difficult problems in speech analysis 1 In principle speech is a nonstationary process the momentary position of the vocal tract may change abruptly at any time This leads to drastic variations in the temporal structure of the signal even between subsequent pitch periods and assuming a quasi periodic signal is often far from realistic 2 Due to the flexibility of the human vocal tract and the wide variety of voices there exist a multitude of possible temporal structures Narrow band formants at low harmonics especially at the second or third harmonic are an additional source of difficulty 3 For an arbitrary speech signal uttered by an unknown speaker the fundamental frequency can vary over a range of almost four octaves 50 to 800 Hz

Synergetics of the Brain E. Basar, H. Flohr, Hermann Haken, A. J. Mandell, 2012-12-06 Synergetics may be considered as an interdisciplinary effort dealing with the general problem of how science can cope with complex systems The preceding symposia on synergetics were devoted to systems of physics chemistry and partly also biology and sociology It was possible to develop adequate concepts to describe and even to calculate evolving macroscopic spatial temporal and functional structures which emerge through self organization of the individual parts of the systems under consideration This book contains the invited papers presented at the Symposium on the Synergetics of the brain Schloss Elmau Bavaria May 2 to 7 1983 The inclusion of this topic in the synergetics enterprise represents a big step towards a treatment of complex systems Most probably the human brain is the most complex system we know of As the organizers believe this symposium provides the reader with a good cross section of experimental results and theoretical approaches to cope with the complex problems of structure and function of the brain It was generally felt that such a joint meeting between experimentalists and theoreticians is of great importance for future development of this field Modern experimental methods e.g. multielectrode derivations allow or will allow us in short to collect huge amounts of data Similarly high speed computers will flood us with an enormous number of outputs once the basic model equations have been chosen

**Neuroethology** J.-P. Ewert, 2012-12-06 Historically the search for the neural bases of behavior goes back a long way Neuroethology which is concerned with the experimental analysis of the releasing and control mechanisms of behavior is a young discipline Results from this multidisciplinary branch of research which uses physical chemical and mathematical methods have not yet been extensively treated in textbooks of neurophysiology and ethology This book is intended as a first attempt to pose major questions of neuroethology and to demonstrate by means of selected research examples some of the ways by which these questions are being approached Inevitably this cannot be a complete and in depth detailed treatment of all of the neurobiology examples and I realize that such a selection is of a subjective nature The overall goal of the book is to present an introduction After outlining some of the very basic neurophysiological and ethological concepts Chaps 2 and 3 neuroethological questions and methods are demonstrated extensively by means of a particular example Chap 4 There are two reasons to choose the visually guided prey catching and avoidance behavior of the Common Toad 1 it is a system which I have investigated for about fifteen years and therefore

know best 2 the toad story is one of the most comprehensive neuro ethological approaches so far Thus it is possible here to outline the major concepts of neuroethology and to pose the basic questions Positron Emission Tomography of the Brain W.-D. Heiss,M.F. Phelps,2012-12-06 The International Symposium on Positron Emission Tomography of the Brain was held at Schloss Auel in Lohmar near Cologne FRG on May 3rd to 8th 1982 This isolated place was chosen to bring together and keep together people active in research employing PET The participants were asked to report their ongoing work to discuss upcoming problems and to indicate future developments In contrast to the large international meetings which suffer from lack of time for discussion and are affected by the distractions of major cities our symposium provided ample opportunity for discussion during the scientific sessions and guaranteed a free exchange of ideas during the leisure time spent together It also gave us the chance to celebrate the founding of a new Max Planck Institute for Neurological Research whose two departments are headed by Dr K A Hossmann and myself and to mark the start of positron emission tomography in our laboratory The book contains the invited papers presented at the meeting and the formal minipapers given at the final general discussion moderated superbly by Dr L Sokoloff In order to accelerate publication the discussions of the individual papers and the final discussion have been omitted However every participant will remember the atmosphere and the highlights of the discussions which gave a special character to the whole event *Directory of Published Proceedings* ,1997 **Hearing**

Schreiner,1979-10-01 o D CREUTZFELDT Max Planck Institut für Biophysikalische Chemie D 3400 Göttingen FRG In the name of the European Brain and Behaviour Society EBBS and the Max Planck Institute for Biophysical Chemistry I welcome you to this workshop on Hearing Mechanisms and Speech It is the aim of EBBS to tackle brain mechanisms of complex behavioral performances Language is certainly a complex behaviour and understanding of language as well Through language an individual is able to express the internal processes within his brain in symbols of this experience and communicate them to others This implies also the description of the world in which we live in as far as this world induces through the sensory organs activities in our brains This symbolical representation of the world is in itself a real world to which our brain relates itself in creating and in understanding it Creutzfeldt 1979 Therefore any specific language influences thinking and broader aspects of behaviour and this may explain some of the differences as found between language populations Herder 1772 Humboldt 1836 In as much as the function of language is a symbolical representation of reality it must be able to describe this reality sufficiently and generally In so far the rules to which any language is subjected are dictated by the reality to which we relate ourselves through language These rules are general and therefore general rules or a universal grammar may be generated common to all languages Chomsky 1965
