Heat and Mass Transfer in Building Energy Performance Assessment Robert Černý, Ákos Lakatos, Václav Kočí, 2019-12-03
The building industry is influenced by many factors and trends reflecting the current situation and developments in social economic technical and scientific fields One of the most important trends seeks to minimize the energy demand This can be achieved by promoting the construction of buildings with better thermal insulating capabilities of their envelopes and better efficiency in heating ventilation and air conditioning systems Any credible assessment of building energy performance includes the identification and simulation of heat and mass transfer phenomena in both the building envelope and the interior of the building As the interaction between design elements climate change user behavior heating effectiveness ventilation air conditioning systems and lighting is not straightforward the assessment procedure can present a complex and challenging task The simulations should then involve all factors affecting the energy performance of the building in questions However the appropriate choice of physical model of heat and mass transfer for different building elements is not the only factor affecting the output of building energy simulations The accuracy of the material parameters applied in the models as input data is another potential source of uncertainty For instance neglecting the dependence of hygric and thermal parameters on moisture content may affect the energy assessment in a significant way Boundary conditions in the form of weather data sets represent yet another crucial factor determining the uncertainty of the outputs In light of recent trends in climate change this topic is vitally important This Special Issue aims at providing recent developments in laboratory analyses computational modeling and in situ measurements related to the assessment of building energy performance based on the proper identification of heat and mass transfer processes in building structures Potential topics include but are not limited to the following Development calibration and validation of advanced mathematical models for the description of heat and mass transfer in building materials and structures Computational modeling of heat and mass transfer in building materials and structures aimed at energy performance assessment Boundary conditions for building energy performance simulations in light of climate change trends Advanced experimental techniques for the determination of heat and mass transport and the storage properties of building materials On site monitoring and verification of building energy performance Research and development of new materials with high potential to improve the energy performance of buildings

Numerical methods for diffusion phenomena in building physics Nathan Mendes,Marx Chhay,Julien Berger,Denys Dutykh,2017-05-19 This book intends to stimulate research in simulation of diffusion problems in building physics by first providing an overview of mathematical models and numerical

techniques such as the finite difference and finite element methods traditionally used in building simulation tools. Then nonconventional methods such as reduced order models, boundary integral approaches and spectral methods are presented which might be considered in the next generation of building energy simulation tools. The advantage of these methods includes the improvement of the numerical solution of diffusion phenomena especially in large domains relevant to building energy performance analysis.

Optimization of Design for Better Structural Capacity Belgasmia, Mourad, 2018-11-16

Despite the development of advanced methods, models and algorithms, optimization within structural engineering remains a primary method for overcoming potential structural failures. With the overarching goal to improve capacity limit structural damage and assess the structural dynamic response, further improvements to these methods must be entertained.

Optimization of Design for Better Structural Capacity is an essential reference source that discusses the advancement and augmentation of optimization designs for better behavior of structure under different types of loads as well as the use of these advanced designs in combination with other methods in civil engineering. Featuring research on topics such as industrial software, geotechnical engineering and systems optimization, this book is ideally designed for architects, professionals, researchers, engineers and academicians seeking coverage on advanced designs for use in civil engineering environments.
