What is it? How can we reduce it?

HOW ACRYLAMIDE FORMS IN FOOD

Acrylamide is a chemical compound that typically forms in **starchy foods** when they are baked, fried or roasted at high-temperatures (120-150°C).

The main chemical reaction is known as the **Maillard reaction**

When the sugar and amino acid naturally present in starchy food are heated, they combine to form substances giving new flavours and aromas. This also causes the browning of the food and produces acrylamide.

Health Implications Of Acrylamide In Food:

Health Implications of Acrylamide in Food Food and Agriculture Organization of the United Nations, 2002-12-28 The FAO WHO Consultation on Health Implications of Acrylamide in Food has undertaken a preliminary evaluation of new and existing data and research on acrylamide The Consultation provided a range of recommendations for further information and new studies to better understand the risk to human health posed by acrylamide in food The Consultation also provided some advice to minimize whatever risk exists including avoiding excessive cooking of food choosing healthy eating investigating possibilities for reducing levels of acrylamide in food and establishing an international network on acrylamide in food The Consultation reviewed the methods of analysis available to test for acrylamide in foodstuffs and food ingredients and for acrylamide and its metabolites as haemoglobin adducts in blood Of the limited range and number of foods analysed to date acrylamide levels are highest in potato and cereal based products subjected to heat processing such as frying grilling or baking However only a limited range of food types have been tested to date and these belong to the Western diet The range of foods investigated needs to be extended to include staple foods from different regions and diets Considered collectively data on the absorption metabolism distribution and excretion of acrylamide suggest that toxicological findings in animals should be assumed to be relevant for extrapolation to humans The Consultation would encourage transparent and open risk assessment and risk management processes and recognises the importance of involving interested parties consumer industry retail etc in this process *Health Implications of Acrylamide in Food* , Printbegr nsninger Der kan printes kapitelvis

Acrylamide and Other Hazardous Compounds in Heat-Treated Foods K Skog, J Alexander, 2006-10-30 Although the aim of cooking foods is to make them more appetizing and microbiologically safe it is now known that cooking and food processing at high temperatures generate various kinds of toxic substances such as heterocyclic amines and acrylamide via the Maillard reaction Summarising the latest research in this field this important collection discusses both the formation of health hazardous compounds during heat treatment of foods and practical methods to minimise their formation Part one analyses the formation of hazardous compounds in heat treated foods such as meat potatoes cereal and coffee Part two discusses the health risks posed by heat induced toxicants It includes chapters on bio monitoring exposure assessment and risk assessment as well as chapters on the risks of specific compounds The final part of the book is concerned with the key area of minimising the formation of harmful compounds in food products This can be achieved by controlling processing conditions and modifying ingredients among other methods With its distinguished editors and international team of contributors with unrivalled academic and industry experience *Acrylamide and other hazardous compounds in heat treated foods* is invaluable for all those concerned with this crucial safety issue throughout the food industry Analyses the formation of health hazardous compounds during heat treatment of foods Discusses practical methods to minimise formation Distinguished editors and international team of contributors **Safety Evaluation of Certain Contaminants in Food** Joint FAO/WHO Expert

Total Diet Studies Gerald G. Moy, Richard W. Vannoort, 2013-11-08 Unless a food is grossly contaminated consumers are unable to detect through sight or smell the presence of low levels of toxic chemicals in their foods Furthermore the toxic effects of exposure to low levels of chemicals are often manifested slowly sometimes for decades as in the case of cancer or organ failure As a result safeguarding food from such hazards requires the constant monitoring of the food supply using sophisticated laboratory analysis While the food industry bears the primary responsibility for assuring the safety of its products the overall protection of people's diets from chemical hazards must be considered one of the most important public health functions of any government Unfortunately many countries do not have sufficient capability and capacity to monitor the exposure of their populations to many potentially toxic chemicals that could be present in food and drinking water Without such monitoring public health authorities in many countries are not able to identify and respond to problems posed by toxic chemicals which may harm their population and undermine consumer confidence in the safety of the food supply From a trade perspective those countries that cannot demonstrate that the food they produce is free of potentially hazardous chemicals will be greatly disadvantaged or even subject to sanctions in the international marketplace The goal of a total diet study TDS is to provide basic information on the levels and trends of exposure to chemicals in foods as consumed by the population In other words foods are processed and prepared as typical for a country before they are analyzed in order to better represent actual dietary intakes Total diet studies have been used to assess the safe use of agricultural chemicals e.g pesticides antibiotics food additives e.g preservatives sweetening agents environmental contaminants e.g lead mercury arsenic cadmium PCBs dioxins processing contaminants e.g acrylamide polycyclic aromatic hydrocarbons chloropropanols and natural contaminants e.g aflatoxin patulin other mycotoxins by determining whether dietary exposure to these chemicals are within acceptable limits Total diet studies can also be applied to certain nutrients where the goal is to assure intakes are not only below safe upper limits but also above levels deemed necessary to maintain good health International and national organizations such as the World Health Organization the European Food Safety Agency and the US Food and Drug Administration recognize the TDS approach as one of the most cost effective means of protecting consumers from chemicals in food for providing essential information for managing food safety including food standards and for setting priorities for further investment and study Total Diet Studies introduces the TDS concept to a wider audience and presents the various steps in the planning and implementation of a TDS It illustrates how TDSs are being used to protect public health from chemicals in the food supply in many developed and developing countries The book also examines some of the applications of TDSs to specific chemicals including contaminants and nutrients
