Endocrinology Of Embryo Endometrium Interactions:

Endocrinology of Embryo—Endometrium Interactions Stanley R. Glasser, Joy Mulholland, Alexandre Psychoyos, 2012-12-06
Early embryonic loss is a continuing social and economic global problem In human populations the estimates of interruptions early in pregnancy range from 35 60% In animal husbandry swine ruminants fully 30% of pregnancies fail to survive early events of gestation The futility associated with this persistent high risk is even more unsettling because of advances made in assisted reproductive technology which although this very selective methodology has added to our knowledge of embryo endometrial interactions has resulted in a birth rate of only 14% These studies have instigated comparisons of the live relative contributions of the embryo and the uterus to the outcome of pregnancy These analyses have shown that we have learned significantly less about the role of the uterus in deciding the outcome of either natural or assisted pregnancies In 1979 a quotation by George Corner was used to set the tone of a meeting that was devoted to discussion of the cellular and molecular aspects of implantation In spite of the proliferation in research activity which occurred in the following 15 years our real understanding of the embryo transfer process has fallen short of our expectations We use the Corner quotation once again to preface this symposium so that we may recall that the fundamental nature of the process which regulates embryo endometrial interactions still escapes us

Brooks A. Keel, Jeffrey V. May, Christopher J. DeJonge, 2000-05-15 With the advent of Assisted Reproductive Technologies our understanding of the reproductive system in both men and women has progressed in an exponential manner Along with this increase in knowledge has emerged new and advanced laboratories performing unique techniques aimed at diagnosing and treating infertility problems And as these lab **Molecular Research of Endometrial Pathophysiology** Paola Viganò, Andrea Romano, 2019-10-14 The endometrium has been the subject of intense research in a variety of clinical settings because of its importance in the reproductive process and its role in women's health In the past 15 years significant efforts have been invested in defining the molecular phenotype of the receptive phase endometrium as well as of various endometrial pathologies Although this has generated a wealth of information on the molecular landscape of human endometrium there is a need to complement this information in light of the novel methodologies and innovative technical approaches The focus of this International Journal of Molecular Sciences Special Issue is on molecular and cellular mechanisms of endometrium and endometrium related disorders The progress made in the molecular actions of steroids in the metabolism of steroids and intracrinology in endometrial intracellular pathways in stem cells biology as well as in the molecular alterations underlying endometrium related pathologies has been the focus of the reviews and papers included

Male-Mediated Developmental Toxicity Andrew F. Olshan, Donald R. Mattison, 2012-12-06 The cause of many of the adverse reproductive outcomes and developmental diseases among offspring is not well understood Most of the epidemiologic and experimental animal research has focused on the relationship between maternal exposures including medications tobacco smoke alcohol infections and occupation and the occurrence of spontaneous abortion low birth weight

and birth defects The potential role of paternal exposures has not been investigated as extensively despite long standing animal research that demonstrates the induction of mutations in the male germ cell after exposure to certain agents and subsequent reproductive failure or early pregnancy loss Given this relative lack of interest acquisition of epidemiologic data and the development of a definitive model or mechanism for potential male mediated effects has been hindered However recent laboratory and epidemiologic investigations have suggested that paternal exposures may be more important than previously suspected This topic has been termed by some as male mediated developmental toxicity This is meant to refer to the effects of exposures and other factors relating to the male parent that result in toxicity to the conceptus and abnormal development The developmental endpoints of interest can include fetal loss congenital abnormalities growth retardation cancer and neurobehavioral effects These effects may operate through a variety of mechanisms including gene mutation chromosomal aberrations seminal fluid transfer of toxicants and epigenetic events

Manual of Embryo Selection in Human Assisted Reproduction Catherine Racowsky,Jacques Cohen,Nicholas Macklon,2023-01-26 Selecting the best embryo to transfer to the uterus is key to successful in vitro fertilization IVF A huge amount of research has been devoted to this topic and there are numerous methods used from simple morphological assessment to molecular biological techniques to assess the genome and metabolism of the newly fertilized embryo For many of these techniques an adequate evidence base is lacking and expert opinion is valuable Clinical imperatives require ranking all embryos in a cohort according to their viability thereby enabling the selection of the best embryo to optimize live birth outcome a key indicator used to measure and rate IVF Clinics worldwide This clear and informative manual will provide embryologists and clinicians with an overview of the tools now available to assist in embryo selection as well as evidence for their efficacy and safety and the broader considerations that must underlie these important clinical decisions
