Energy Conservation In Industry Combustion Heat And Ranking Cycle Machines:

Energy Conserve in Industry — Combustion, Heat Recovery and Rankine Cycle Machines H. Ehringer, G. Hoyaux, P. Pilavachi, 2013-04-18 The main objectives of the Community's energy policy consist of securing a sufficient energy supply for the present and future demand of its Member States and in reducing the Community's dependence on imported energy through the more rational use of energy and a broader diversification of supply. This requires a full set of common efforts at all levels including energy research and development. In the framework of its strategy for scientific and technological research, the Commission of the European Communities has launched several R & D programmes in the field of energy. These programmes are implemented either directly in its Joint Research Centre or by concluding contracts with research institutions in the EC Member countries. One of the most important short and medium term objectives of the present four year Energy R & D Programme 1979-1983 approved by the Council of Ministers on 13 September 1979 aims at fostering energy conservation technologies in the three main energy consuming sectors domestic industry and transport. In the European Community more than 35% of the energy is consumed in industry. About 23% of the imported oil is used in this sector. Two thirds of this energy are used for heating purposes. Consequently there is a high potential for residuary heat recovery. In order to enhance rational use of energy and energy conservation in the Member States of the Community it is necessary among other things to promote the development of combustion and energy recovery techniques. Energy Conservation in Industry - Combustion, Heat Recovery and Rankine Cycle Machines Energy R&D Programme of the Commission of the European Communities, 1982 *Energy Efficiency in Industry* J. Sirchis, 2003-09-02 Proceedings of a workshop organized by the Commission of the European Communities Directorate General for Energy Berlin Germany 19-20 October 1987 **Energy Conservation in Industry**, 1983 Energy Abstracts for Policy Analysis, 1986 Closed Power Cycles Costante Mario Invernizzi, 2013-06-03 With the growing attention to the exploitation of renewable energies and heat recovery from industrial processes the traditional steam and gas cycles are showing themselves often inadequate. The inadequacy is due to the great assortment of the required sizes power and of the large kind of heat sources. Closed Power Cycles Thermodynamic Fundamentals and Applications offers an organized discussion about the strong interaction between working fluids the thermodynamic behavior of the cycle using them and the technological design aspects of the machines. A precise treatment of thermal engines operating in accordance with closed cycles is provided to develop ideas and discussions strictly founded on the basic thermodynamic facts that control the closed cycles operation and design. Closed Power Cycles Thermodynamic Fundamentals and Applications also contains numerous examples which have been carried out with the help of the Aspen Plus R program. Including chapters on binary cycles the organic Rankine cycle and real closed gas cycles. Closed Power Cycles Thermodynamic Fundamentals and Applications acts as a solid introduction and reference for post graduate students and researchers working in applied thermodynamics and energy conversion with thermodynamic engines.
