Computational Contact Mechanics Peter Wriggers, 2006-10-06 Contact mechanics has its application in many engineering problems No one can walk without frictional contact and no car would move for the same reason Hence contact mechanics has from an engineering point of view a long history beginning in ancient Egypt with the movement of large stone blocks over first experimental contributions from leading scientists like Leonardo da Vinci and Coulomb to today's computational methods In the past contact conditions were often modelled in engineering analysis by more simple boundary conditions since analytical solutions were not present for real world applications In such cases one investigated contact as a local problem using the stress and strain fields stemming from the analysis which was performed for the entire structure With the rapidly increasing power of modern computers more and more numerical simulations in engineering can include contact constraints directly which make the problems nonlinear This book is an account of the modern theory of nonlinear continuum mechanics and its application to contact problems as well as of modern simulation techniques for contact problems using the finite element method The latter includes a variety of discretization techniques for small and large deformation contact Algorithms play another prominent role when robust and efficient techniques have to be designed for contact simulations Finally adaptive methods based on error controlled finite element analysis and mesh adaptation techniques are of great interest for the reliable numerical solution of contact problems Modeling Complex Turbulent Flows Manuel D. Salas, Jerry N.

Hefner, Leonidas Sakell, 2012-12-06 Turbulence modeling both addresses a fundamental problem in physics the last great unsolved problem of classical physics and has far reaching importance in the solution of difficult practical problems from aeronautical engineering to dynamic meteorology However the growth of supercomputer facilities has recently caused an apparent shift in the focus of turbulence research from modeling to direct numerical simulation DNS and large eddy simulation LES This shift in emphasis comes at a time when claims are being made in the world around us that scientific analysis itself will shortly be transformed or replaced by a more powerful paradigm based on massive computations and sophisticated visualization Although this viewpoint has not lacked articulate and influential advocates these claims can at best only be judged premature After all as one computational researcher lamented the computer only does what I tell it to do and not what I want it to do In turbulence research the initial speculation that computational methods would replace not only model based computations but even experimental measurements have not come close to fulfillment It is becoming clear that computational methods and model development are equal partners in turbulence research DNS and LES remain valuable tools for suggesting and validating models while turbulence models continue to be the preferred tool for practical computations We believed that a symposium which would reaffirm the practical and scientific importance of turbulence modeling was both necessary and timely **Advances in Adaptive Computational Methods in Mechanics** P.

Ladeveze, J.T. Oden, 1998-06-23 Mastering modelling and in particular numerical models is becoming a crucial and central question in modern computational mechanics. Various tools able to quantify the quality of a model with regard to another one taken as the reference have been derived. Applied to computational strategies, these tools lead to new computational methods which are called adaptive. The present book is concerned with outlining the state of the art and the latest advances in both these important areas. Papers are selected from a Workshop Cachan 17-19 September 1997 which is the third of a series devoted to Error Estimators and Adaptivity in Computational Mechanics. The Cachan Workshop dealt with latest advances in adaptive computational methods in mechanics and their impacts on solving engineering problems. It was centered too on providing answers to simple questions such as what is being used or can be used at present to solve engineering problems. What should be the state of art in the year 2000? What are the new questions involving error estimators and their applications?
