Fractal Based Point Processes:

Fractal-Based Point Processes Steven Bradley Lowen, Malvin Carl Teich, 2005-09-19 An integrated approach to fractals and point processes This publication provides a complete and integrated presentation of the fields of fractals and point processes from definitions and measures to analysis and estimation The authors skillfully demonstrate how fractal based point processes established as the intersection of these two fields are tremendously useful for representing and describing a wide variety of diverse phenomena in the physical and biological sciences Topics range from information packet arrivals on a computer network to action potential occurrences in a neural preparation The authors begin with concrete and key examples of fractals and point processes followed by an introduction to fractals and chaos Point processes are defined and a collection of characterizing measures are presented With the concepts of fractals and point processes thoroughly explored the authors move on to integrate the two fields of study Mathematical formulations for several important fractal based point process families are provided as well as an explanation of how various operations modify such processes The authors also examine analysis and estimation techniques suitable for these processes Finally computer network traffic an important application used to illustrate the various approaches and models set forth in earlier chapters is discussed Throughout the presentation readers are exposed to a number of important applications that are examined with the aid of a set of point processes drawn from biological signals and computer network traffic Problems are provided at the end of each chapter allowing readers to put their newfound knowledge into practice and all solutions are provided in an appendix An accompanying Web site features links to supplementary materials and tools to assist with data analysis and simulation With its focus on applications and numerous solved problem sets this is an excellent graduate level text for courses in such diverse fields as statistics physics engineering computer science psychology and neuroscience

Self-Similar Processes in Telecommunications Oleg Sheluhin, Sergey Smolskiy, Andrew Osin, 2007-03-13 For the first time the problems of voice services self similarity are discussed systematically and in detail with specific examples and illustrations Self Similar Processes in Telecommunications considers the self similar fractal and multifractal models of telecommunication traffic and efficiency based on the assumption that its traffic has fractal or multifractal properties is self similar The theoretical aspects of the most well known traffic models demonstrating self similar properties are discussed in detail and the comparative analysis of the different models efficiency for self similar traffic is presented This book demonstrates how to use self similar processes for designing new telecommunications systems and optimizing existing networks so as to achieve maximum efficiency and serviceability The approach is rooted in theory describing the algorithms the logical arithmetical or computational procedures that define how a task is performed for modeling these self similar processes However the language and ideas are essentially accessible for those who have a general knowledge of the subject area and the advice is highly practical all models problems and solutions are illustrated throughout using numerous real world examples Adopts a detailed theoretical yet broad based and practical

mathematical approach for designing and operating numerous types of telecommunications systems and networks so as to achieve maximum efficiency Places the subject in context describing the current algorithms that make up the fractal or self similar processes while pointing to the future development of the technology Offers a comparative analysis of the different types of self similar process usage within the context of local area networks wide area networks and in the modeling of video traffic and mobile communications networks Describes how mathematical models are used as a basis for building numerous types of network including voice audio data video multimedia services and IP Internet Protocol telephony The book will appeal to the wide range of specialists dealing with the design and exploitation of telecommunication systems It will be useful for the post graduate students lecturers and researchers connected with communication networks disciplines

Nait-Ali, 2009-04-21 Generally speaking Biosignals refer to signals recorded from the human body They can be either electrical e.g. Electrocardiogram ECG Electroencephalogram EEG Electromyogram EMG etc or non electrical e.g. breathing movements etc The acquisition and processing of such signals play an important role in clinical routines They are usually considered as major indicators which provide clinicians and physicians with useful information during diagnostic and monitoring processes In some applications the purpose is not necessarily medical It may also be industrial For instance a real time EEG system analysis can be used to control and analyze the vigilance of a car driver In this case the purpose of such a system basically consists of preventing crash risks Furthermore in certain other applications a set of biosignals e.g. ECG respiratory signal EEG etc can be used to control or analyze human emotions This is the case of the famous polygraph system

also known as the lie detector the efficiency of which remains open to debate Thus when one is dealing with biosignals special attention must be given to their acquisition their analysis and their processing capabilities which constitute the final stage preceding the clinical diagnosis Naturally the diagnosis is based on the information provided by the processing system

Networks of Echoes Bruce J. West,Malgorzata Turlaska,Paolo Grigolini,2014-04-03 *Networks of Echoes* Imitation Innovation and Invisible Leaders is a mathematically rigorous and data rich book on a fascinating area of the science and

engineering of social webs There are hundreds of complex network phenomena whose statistical properties are described by inverse power laws The phenomena of interest are not arcane events that we encounter only fleetingly but are events that dominate our lives We examine how this intermittent statistical behavior intertwines itself with what appears to be the organized activity of social groups The book is structured as answers to a sequence of questions such as How are decisions reached in elections and boardrooms How is the stability of a society undermined by zealots and committed minorities and how is that stability re established Can we learn to answer such questions about human behavior by studying the way flocks of birds retain their formation when eluding a predator These questions and others are answered using a generic model of a complex dynamic network one whose global behavior is determined by a symmetric interaction among individuals based on social imitation The complexity of the network is manifest in time series resulting from self organized critical dynamics that have divergent first and second moments are non stationary non ergodic and non Poisson How phase transitions in the network dynamics influence such activity as decision making is a fascinating story and provides a context for introducing many of the mathematical ideas necessary for understanding complex networks in general The decision making model DMM is selected to emphasize that there are features of complex webs that supersede specific mechanisms and need to be understood from a general perspective This insightful overview of recent tools and their uses may serve as an introduction and curriculum guide in related courses
