Macromolecular Chemistry A. D. Jenkins, John F. Kennedy, 1980 Specialist Periodical Reports provide systematic and detailed review coverage of progress in the major areas of chemical research Written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry For over 80 years the Royal Society of Chemistry and its predecessor the Chemical Society have been publishing reports charting developments in chemistry which originally took the form of Annual Reports However by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series Specialist Periodical Reports was born The Annual Reports themselves still existed but were divided into two and subsequently three volumes covering Inorganic Organic and Physical Chemistry For more general coverage of the highlights in chemistry they remain a must Since that time the SPR series has altered according to the fluctuating degree of activity in various fields of chemistry Some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued The current list of Specialist Periodical Reports can be seen on the inside flap of this volume

Advances in Chromatography J. Calvin Giddings, 1983-03-09

Block Copolymers Nikos Hadjichristidis, Stergios Pispas, George Floudas, 2003-04-14 Polymers may be classified as either homopolymers consisting of one single repeating unit or copolymers consisting of two or more distinct repeating units

Block copolymers contain long contiguous blocks of two or more repeating units in the same polymer chain. Covering one of the hottest topics in polymer chemistry, *Block Copolymers* provides a coherent overview of the synthetic routes, physical properties, and applications of block copolymers. This pioneering text provides not only a guideline for developing synthetic strategies for creating block copolymers with defined characteristics but also a key to the relationship between the physical properties of block copolymers and the structure and dynamics of materials. Covering features of the chemistry and physics of block copolymers that are not found in comparable texts, *Block Copolymers* illustrates the structure-activity relationship of block copolymers and offers suggestions for the design of specific applications. Divided into five sections, *Block Copolymers* includes chapters on Block Copolymers by Chemical Modification of Precursor Polymers, Nonlinear Block Copolymers, Adsorption of Block Copolymers at Solid-Liquid Interfaces, Theory of Block Copolymer Segregation, Phase Transformation Kinetics, Block Copolymer Morphology, and Block Copolymer Dynamics. Polymer chemists, physicists, chemical engineers, and materials scientists, as well as graduate students in polymer science, will find *Block Copolymers* to be an invaluable text.

Steric Exclusion Liquid Chromatography of Polymers Josef Janča, 1984-01-30 **Thermodynamics of Systems Containing Flexible-Chain Polymers** V.J. Klenin, 1999-06-03

This book deals with the problems of the thermodynamics of systems containing flexible chain polymers as the basis of polymer material science. The main thermodynamic quantities and concepts are introduced and discussed in the order of the objects getting more and more complicated: gases, magnets, low molecular weight substances, and mixtures, and finally polymers and polymer blends. All topics are considered in a common clue using the principle of universality. The stability conditions for the one-phase state of multi-component systems are given. Phase separation is regarded as a result of loss in stability. The critical state of a system with the one-phase state being close to the boundary of stability conditions breaking is discussed in detail. The effects of both light scattering, elastic, and dynamic diffusion as directly depending on the thermodynamic parameters characterizing the one-phase state stability are considered in detail. One of the versions of colloid scattering, namely the turbidity spectrum method, is described as useful for the characterization of various heterogeneous structures and for the phase analysis of polymer systems. In the approximation of mean-field theories and advanced field theory formalisms, the following divisions of the thermodynamics of binary and polynary systems with flexible chain polymers are expounded: conformation of the polymer coil, composition fluctuations, elastic and dynamic light scattering, diffusion in the one-phase state, including the critical range, phase separation, polymer fractionation, the coil-globule transition, phase equilibrium, and separation in the system network polymer, low molecular weight liquid polymer blends, and multiphase separation.
