Software Engineering for Experimental Robotics Davide Brugali,2007-04-16 Software Engineering for Experimental

Robotics collects contributions that describe the state of the art in software development for the Robotics domain. It reports on innovative ideas that are progressively introduced in the software development process in order to promote the reuse of robotic software artifacts, domain engineering components, frameworks, and architectural styles. It illustrates the results of the most successful and well-known research projects which aim to develop reusable robotic software systems. Most of the chapters report on concepts and ideas discussed at the well-attended ICRA2005 Workshop on Principles and Practice of Software Development in Robotics, Barcelona, Spain, April 18, 2005. The authors are recognised as leading scholars internationally, and the result is an effective blend of fundamental and innovative results on research and development in software for robotic systems where one common factor is the integration of reusable building blocks. Besides the advancement in the field, most contributions survey the state of the art, report a number of practical applications to real systems, and discuss possible future developments.

Model-Driven Software Development: Integrating Quality

Assurance Rech, Jörg, Bunse, Christian, 2008-08-31. Covers important concepts, issues, trends, methodologies, and technologies in quality assurance for model-driven software development.

Generative and Component-Based Software Engineering Jan Bosch, 2001-08-29. This book constitutes the refereed proceedings of the Third International Conference on Generative and Component-Based Software Engineering GCSE 2001, held in Erfurt, Germany, in September 2001. The 14 revised full papers presented together with one invited paper were carefully reviewed and selected from 43 submissions. The papers are organized in topical sections on software product lines, aspects, generic and generative approaches, and components and architectures.

Component-Based Software Development for Embedded Systems Colin Atkinson, Christian Bunse, Hans-Gerhard Gross, Christian Peper, 2005-11-19. Embedded systems are ubiquitous. They appear in cell phones, microwave ovens, refrigerators, consumer electronics, cars, and jets. Some of these embedded systems are safety or security critical, such as in medical equipment, nuclear plants, and X-by-wire control systems in naval ground and aerospace transportation vehicles. With the continuing shift from hardware to software, embedded systems are increasingly dominated by embedded software. Embedded software is complex. Its engineering inherently involves a multidisciplinary interplay with the physics of the embedding system or environment. Embedded software also comes in ever larger quantity and diversity. The next generation of premium automobiles will carry around one gigabyte of binary code. The proposed US DDX submarine is effectively a floating embedded software system comprising 30 billion lines of code written in over 100 programming languages. Embedded software is expensive. Cost estimates are quoted at around US \$15-30 per line from commencement to shipping. In the defense realm, costs can range up to \$100 while for highly critical applications such as the Space Shuttle, the cost per line approximates \$1,000. In view of the exponential increase in complexity, the projected costs of future embedded software are staggering.
