Guide to the Laboratory Diagnosis of Trachoma. Prepared by the participants in a WHO Symposium. (Pp. 40; 16 figures; Sw. Fr. 12.) Geneva: World Health Organization, 1975.

This booklet is intended to provide 'a system of recommended procedures for use especially in the diagnosis of trachoma in countries where . . . laboratory facilities may be limited'. Methods are given for collecting specimens, detecting inclusion bodies by ordinary and fluorescence microscopy, isolating *Chlamydia*, and typing strains. The amount of detail makes this a useful working manual; but sophisticated techniques such as the use of irradiated cell cultures for isolation and serotyping by microimmunofluorescence are over-emphasized at the expense of simpler methods such as iodine-staining of inclusions and isolation in unirradiated cells. One of the most valuable features is the set of good colour photographs of Giemsa-stained inclusion bodies and other intracytoplasmic objects that may be mistaken for them.

Human Viral Hepatitis. By A. J. Zuckerman. (Pp. x + 422; illustrated, \$49.95.) Amsterdam: North Holland Publishing Company, 1975.

The second edition of *Human Viral Hepatitis* is twice the length of the first, which appeared only three years ago as *Hepatitis Associated Antigens and Viruses*. The new title does not reflect a major change in approach. The original material has been revised and pruned, while the general balance of the book has been improved by its expansion to include a description of the newly recognized particles found in the faeces of patients with hepatitis A.

As before, each chapter consists of a review of the published work on a limited topic, and the reference lists will provide useful guides to the English language literature. The new illustrations are well chosen but several of the electron micrographs of hepatitis B show similar features and could be deleted. The reviews are written from an essentially academic standpoint and consist largely of abstracts of the findings reported in individual

Chlamydia P.A. Mardh, J. Paavonen, M. Puolakkainen, 2012-12-06 During recent decades it has been firmly documented that chlamydiae are common and important pathogens in humans and animals In humans chlamydiae are known to cause trachoma which is still one of the major blinding diseases in the world and are also one of the most common etiological agents of sexually transmitted diseases and the sequelae thereof such as infertility In the last few years it has also become evident that chlamydiae i.e. the so called TWAR agents are common respiratory tract pathogens Chlamydiae are also important pathogens in birds and lower mammals in whom they cause a variety of infectious conditions a spectrum which has increased every year Some of these infections occur as zoonoses e.g. psittacosis ornithosis and as recently discovered abortion Knowledge of the molecular biology and immunobiology of chlamydiae has expanded rapidly during recent years Insight into the pathophysiology of chlamydial infections has also increased and new methods for the diagnosis of chlamydial infections have been introduced The importance of establishing control and preventive programs for chlamydial infections

has become obvious in order to combat the present chlamydial epidemic We hope that this book can usefully serve those who want to increase their general knowledge of Chlamydia and that it can act as a handbook and reference source for those involved in chlamydial research as well as for those working with chlamydial infections in medical and veterinary clinical disciplines including clinical laboratories

Weiss, Anne Henderson Siegle, Dory Storms, Meenakshi Ramakrishnan, William J. Moss, 2005-12-08 Addressing the health needs of children in complex emergencies is critical to the success of relief efforts and requires coordinated and effective interventions However little systematic work has been undertaken to evaluate such care To address this need this monograph presents a review of the published literature in this area providing background on the burden of disease the major causes of morbidity and mortality and the evidence base for effective interventions It also describes surveys of nongovernmental organizations NGOs and international agencies providing care to children in complex emergencies which were conducted to identify guidelines commonly used to provide such care and assesses the content and limitations of these guidelines A more in depth survey of several organizations was also conducted to assess obstacles to this kind of care On the basis of the survey findings and the review of the published literature the working group recommended that evidence based locally adapted guidelines to address the curative and preventive care of children in complex emergencies and health systems planning should be adopted by ministries of health and supported by the World Health Organization WHO and UNICEF The guidelines should target as much as possible the different levels of health care workers

providing care to children to ensure appropriate effective and uniform care in a variety of situations Child Health in Complex Emergencies presents specific examples of areas for further research and guideline development This report is not intended to be an exhaustive and definitive assessment of child health in complex emergencies The topic is much too vast and complex and different individuals and institutions will have incompatible perspectives Rather we aim to provide a starting point for discussion and debate on how to improve the care of children in these settings *Medical Microbiology E-Book* David Greenwood, Richard C B Slack, Michael R.
