

Embryonic stem cell research: an ethical dilemma

What are the issues being discussed?

Research with embryonic stem cells (ESCs) is highly debated and many people have strong opinions about it. Both sides of the debate are interested in protecting human life, so why are views so different? It comes down to how the human blastula is viewed.

ESCs are primarily made from cells found in a human blastula, one of the earliest stages of human life. A fertilised egg grows into a blastula (made of ~100 cells), which can only survive for a short time before it must be implanted in a womb. Blastulas used in research are typically made artificially in a laboratory or fertility clinic.

In November 1998 President Clinton charged the National Bioethics Advisory Commission with the task of conducting a thorough review of the issues associated with human stem cell research balancing all ethical and medical considerations The President s request was made in response to three separate reports that brought to the fore the exciting scientific and clinical prospects of stem cell research while also raising a series of ethical controversies regarding federal sponsorship of scientific inquiry in this area Scientific reports of the successful isolation and culture of these specialized cells have offered hope of new cures for debilitating and even fatal illness and at the same time have renewed an important national debate about the ethics of research involving human embryos and cadaveric fetal material The stem cell is a unique and essential cell type found in animals Many kinds of stem cells are found in the body with some more differentiated or committed to a particular function than others In other words when stem cells divide some of the progeny mature into cells of a specific type e g heart muscle blood or brain cells while others remain stem cells ready to repair some of the everyday wear and tear undergone by our bodies These stem cells are capable of continually reproducing themselves and serve to renew tissue throughout an individual s life For example they constantly regenerate the lining of the gut revitalize skin and produce a whole range of blood cells Although the term stem cell commonly is used to refer to the cells within the adult organism that renew tissue e g hematopoietic stem cells a type of cell found in the blood the most fundamental and extraordinary of the stem cells are found in the early stage embryo These embryonic stem ES cells unlike the more differentiated adult stem cells or other cell types retain the special ability to develop into nearly any cell type Embryonic germ EG cells which originate from the primordial reproductive cells of the developing fetus have properties similar to ES cells It is the potentially unique versatility of the ES and EG cells derived respectively from the early stage embryo and cadaveric fetal tissue that presents such unusual scientific and therapeutic promise Indeed scientists have long recognized the possibility of using such cells to generate more specialized cells or tissue which could allow the generation of new cells to be used to treat injuries or diseases such as Alzheimer s disease Parkinson s disease heart disease and kidney failure Likewise scientists regard these cells as an important perhaps essential means for understanding the earliest stages of human development and as an important tool in the development of life saving drugs and cell replacement therapies to treat
