Waltner,2012-01-05 This volume describes mesoscopic systems with classically chaotic dynamics using semiclassical methods which combine elements of classical dynamics and quantum interference effects Experiments and numerical studies show that Random Matrix Theory RMT explains physical properties of these systems well This was conjectured more than 25 years ago by Bohigas Giannoni and Schmit for the spectral properties Since then it has been a challenge to understand this connection analytically The author offers his readers a clearly written and up to date treatment of the topics covered He extends previous semiclassical approaches that treated spectral and conductance properties He shows that RMT results can in general only be obtained semiclassically when taking into account classical configurations not considered previously for example those containing multiply traversed periodic orbits Furthermore semiclassics is capable of describing effects beyond RMT In this context he studies the effect of a non zero Ehrenfest time which is the minimal time needed for an initially spatially localized wave packet to show interference He derives its signature on several quantities characterizing mesoscopic systems e g dc and ac conductance dc conductance variance n pair correlation functions of scattering matrices and the gap in the density of states of Andreev billiards Intensity Modulated Radiation Therapy Arno J. Mundt,John C. Roeske,2005 Presents the technical aspects of IMRT and the clinical aspects of planning and delivery The volume explores a practical approach for radiation oncologists and medical physicists initiating or expanding an IMRT program the fundamental biology and physics of IMRT a site by site review of IMRT techniques with clinical examples and reviews of published outcome studies
