

DISCOVERING RENAL LITHIASIS

FOR ROSALDO JIMENEZ MARILU
RAMIREZ VARGAS GUILLERMO

Renal lithiasis is a disease caused by the presence of calculi, or stones, inside the kidneys or urinary tract (ureter or bladder). It is also known as urolithiasis or nephrolithiasis. A stone (calculus) can be as small as a grain of sand or as big as a pearl. Most kidney stones are eliminated naturally. Sometimes, a stone is not easy for the body to eliminate and medical or surgical treatment is required. During its elimination it may stay in the urinary tract, blocking the flow of urine and causing a great deal of pain and complications.

CAUSES OF RENAL LITHIASIS CALCIUM LITHIASIS.

This is the most common type of lithiasis. It accounts for 70-80% of all lithiasis cases. These stones form due to increased concentrations of calcium in the urine. They are composed of calcium oxalate (36-70%).

ABSORPTIVE.

When the excess calcium in the urine is due to increased intestinal absorption.

EXCRETORY.

When the excess calcium in the urine is due to the kidney eliminating much more calcium than normal.

BONE RESORPTIVE

When the excess calcium in the urine is due to increased bone resorption of calcium. The most common example of this type of disorder is primary hyperparathyroidism.

SYMPTOMS

Colicky lumbar pain (with peaks and troughs of intensity) that can radiate to the front of the abdomen and even reach the genital area (vulva and penis).

If fever occurs, this is a warning of possible associated septic shock.

Nausea and vomiting.

DIAGNOSING

Medical history. This provides information on the family history (40-50% of cases), eating habits, medicines taken, diseases predisposing to urinary lithiasis, environmental factors (work stress, climate, job, etc.) and whether the lithiasis is recurrent, i.e. whether there have been previous episodes.

Urine and blood test.

Simple abdominal X-ray.

Ultrasound.
