Genetic Control of the Susceptibility to Bacterial Infection David E. Briles, 2012-12-06 National Library of Medicine Current Catalog National Library of Medicine (U.S.), **Monoclonal Antibodies Against Bacteria** Alberto J. L. Macario, Everly Conway de Macario, 2014-05-10 Monoclonal Antibodies Against Bacteria Volume III covers the basis for understanding developments of practical importance in the health sciences within the area of microbiology and infectious diseases focusing on advances made possible by monoclonal antibodies This 12 chapter volume specifically considers the basic principles of hybridoma technology The introductory chapters deal with treponemal antigens of significance for understanding syphilis yaws pinta salmonellosis and other gastroenteropathies The subsequent chapters highlight pediatric infections and the strategies for molecular analyses of bacterial antigens focusing on cell walls S layers and sheaths The remaining chapters examine the bacterial toxins involved in gaseous gangrene and other forms of cell damage such as diphtheria caries and periodontal diseases and bacteria relevant to animal sciences This book will prove useful to internists pediatricians surgeons dentists veterinarians clinical pathologists and laboratory technologists **Retrovirus Infections of the Nervous System** Michael B.A. Oldstone, Hilary Koprowski, 2012-12-06 Although retroviruses have long been associated with a variety of animal diseases active research in the field of human retroviruses dates from the discovery of human immunodeficiency virus HIV in association with acquired immunodeficiency syndrome AIDS The enormous research efforts in this field have been directed toward understanding the nature of the virus and toward its elimination through prevention and the cure of the disease Human T cell leukemia virus HTLV I was the first member of the human retrovirus family to be discovered It was implicated as the cause of adult T cell leukemia ATL even before the association of HIV and AIDS was established Research on HTLV I has however been lagging behind that of HIV because of the importance of AIDS Today HTLV I and possibly closely related HTLV II are associated with a variety of human neurologic diseases and research activities in this field may show that human retroviruses can cause a variety of human diseases in addition to those affecting the nervous system Papers in this volume attempt to acquaint the reader with the present state of research into retrovirus infection and related diseases of the nervous system **International Archives of Allergy and Applied Immunology**, 1987 **Mechanisms in B-Cell Neoplasia 1990** Michael Potter, Fritz Melchers, 2013-03-12 The eighth workshop in this series on Mechanisms in B Cell Neoplasia 1990 was held in Wilson Hall at the National Institutes of Health Bethesda Maryland on March 28-30 Five major topics formed the basis for the discussions 1 progress in experimental models of B cell tumorigenesis 2 the role of IL-6 in plasma cell tumor formation with particular emphasis on human myeloma 3 immortalization and regulation of mitosis in B cells 4 the MYC gene in B cell neoplasia and 5 the role of EBV and other oncogenes in transformation of human B lymphocytes A meeting on the Epidemiology of Myeloma was held at the NIH on the preceding

day and many of those interested in the clinical aspects of myeloma were also participants at the workshop Experimental Models of B Cell Tumor Development We have seen in the last eight years the steady growth of model experimental systems many of which have been designed to be counter parts of the major forms of human B cell tumors e g follicular lymphomas Burkitt s lymphomas acute B cell leukemia and multiple myeloma A variety of novel ways of inducing these tumors has been described Advantage has been taken of the experiments in nature to identify critical genes that play a role in tumor pathogenesis These genes have been identified by being near to viral insertion and chromosomal translocation sites or by having been incorporated or transduced into a defective transforming retrovirus

Current Catalog National Library of Medicine (U.S.), First multi year cumulation covers six years 1965-70

Picornaviruses Vincent R. Racaniello, 2012-12-06 This volume provides a comprehensive up to date review of the most active areas in picornavirus research Included are chapters on picornavirus receptors translation protein processing RNA replication antigenic structure and genetics The work described represents the fruit of technological advances in the field realized at the beginning of the 1980 s and provides an outline for future experimentation

Retroviruses Ronald Swanstrom, Peter K. Vogt, 2012-12-06 This book gives a synthesis of current knowledge on retrovirology Each chapter deals with a different step in the virus life cycle detailing the molecular aspects of virus replication The comparison of different retroviruses exemplifies variations Specific topics include the evolution of retrovirus genomes integration of the provirus viral DNA transcriptional and translational control of viral gene expression processing of viral proteins and packaging of virion RNA Data on HIV and HTLV 1 are covered as well as research on animal retrovirus systems

Hepadnaviruses William S. Mason, Christoph Seeger, 2012-12-06 Pioneering work on hepatitis B virus and hepatitis delta virus and the discovery of hepatitis B like virus in animals during the 1970 s has been followed over the past ten years by an explosion of interest in how these viruses replicate maintain chronic infections and cause liver disease and hepatocellular carcinoma The purpose of this book is two fold First the authors of each chapter provide a summary of their specialty that will not only serve as an introduction but will also provide the newcomer to hepatitis B virology with up to date information and insights into the goals and accomplishments of each area of investigation Second since the diversification of interests and increased specialization of hepadnaviruses researchers has reached a level where it is no longer possible for any one individual to read all the primary literature this book will help to refocus interest on what is after all the major objective to understand and ultimately treat or prevent chronic liver disease and liver cancer Accordingly chapters are included which span a range of interests from the management of hepatitis B patients to new approaches to antiviral therapy from the role of hepadnavirus gene expression in DNA replication to the role of ribozymes in the delta virus life cycle from liver cancer in naturally infected woodchucks to liver disease in HBV transgenic mice to the use of hepatitis virus vectors to treat inherited enzyme deficiencies

The Role of Viruses and the Immune System in Diabetes Mellitus Thomas Dyrberg, 2013-06-29 Research in diabetes has accelerated in two areas both of which are being reviewed in

CTMI The first is the use of a variety of animal models the second is basic research in human investigation islet cell antigens and mapping of genes as associated with susceptibility to disease Dr Thomas Dyrberg accepted editorial responsibility for this volume which covers the first area A second book to be published later in the year is edited by Drs Brekkeskov and Hansen CTMI 164 see page VI for contents Although the contributors to both volumes represent the international scientific community the editors are from the Hagedorn Research Laboratory in Denmark Work at this institute and the Steno Memorial Hospital has been dedicated to research in diabetes for decades and the institutions were appointed WHO Collaborating Centres for Research and Training on the Pathogenesis of Diabetes Mellitus in 1983 It is worth noting that while addressing the hypothesis of the role of class II major histocompatibility glycoproteins in autoimmune diabetes insulin dependent diabetes IDDM a number of investigators established animal models in which class II molecules were expressed under the control of the rat insulin promoter While generating interesting information on IDDM the finding of immunologic tolerance in such transgenic mice has attracted the attention of several basic immunologic laboratories for quite different reasons Thus we are reminded again of the Pasteur dictum that chance favors the prepared mind Michael B A Oldstone M D

Revue Roumaine de Biochimie, 1987 *Immunological Memory* David Gray, Jonathan Sprent, 2013-03-07 Although immunologists know rather a lot about the manifestation of immunological memory an understanding of the mechanism of memory at cellular and biochemical levels eludes us Indeed as we shall see it is not even clear which of the several models used to explain the working of memory approximates to the truth It is in order to report on approaches to this problem and on recent experimental advances in the field of memory cells that this volume has been put together In the past 4-5 years cell surface molecules that may enable us to define memory B and T cells have been identified It may now be possible to ask how memory cells are generated and to define what signals are required during or after antigenic encounter for a cell to enter the memory cell pool rather than to terminally differentiate into an effector cell The transition from virgin cell to memory cell is clearly accompanied by several biochemical changes For B cells isotype switching and somatic mutations leading to affinity maturation are well defined phenomena although the molecular mechanisms remain mysterious Both have received attention in many excellent reviews of late and so are not considered in detail in this book Neither switching nor somatic mutation is a feature of peripheral T cell maturation biochemical differences between virgin and memory T cells may only relate to differing activation requirements and possibly changes in the expression of accessory molecules Poxviruses Richard W. Moyer, Peter C. Turner, 2012-12-06 The purpose of this volume is to highlight some current areas of poxvirus research which are likely to be particularly fruitful in the upcoming few years The first chapter by Drs Condit and Niles discusses poxvirus genetics Work in this area has provided mutants produced practical procedures to simplify the manipulation of viral genes and generated information about the molecular architecture and organization of genes characteristic of pox viruses One of the most intensively studied regions of the viral genome is the HindIII D region of

vaccinia in which a combination of classical and molecular genetic analysis of the region has been particularly revealing Within this region are open reading frames some of which are expressed early and others late organized in a fashion which is now known to be typical of these viruses Other studies related to temperature sensitive drug resistant and drug dependent mutants are also discussed Each of the other reviews included in this volume summarizes areas of research which have depended heavily on the genetics of the system The intracellular site of a poxvirus infection is mostly if not exclusively limited to the cytoplasm which dictates several interesting biological ramifications For example poxvirus transcription must occur in the cytoplasm rather than in the nucleus The virus copes with this situation by incorporating into the virion the enzymatic machinery necessary to initiate transcription from input virus
