Genetic Algorithms And Investment Strategies:

Genetic Algorithms and Investment Strategies Richard J. Bauer, 1994-03-31 When you combine nature's efficiency and the computer's speed the financial possibilities are almost limitless. Today's traders and investment analysts require faster, sleeker weaponry in today's ruthless financial marketplace. Battles are now waged at computer speed with skirmishes lasting not days or weeks but mere hours. In his series of influential articles, Richard Bauer has shown why these professionals must add new computerized decision-making tools to their arsenal if they are to succeed. In *Genetic Algorithms and Investment Strategies*, he uniquely focuses on the most powerful weapon of all, revealing how the speed, power, and flexibility of GAs can help them consistently devise winning investment strategies. The only book to demonstrate how GAs can work effectively in the world of finance, it first describes the biological and historical bases of GAs, as well as other computerized approaches such as neural networks and chaos theory. It goes on to compare their uses, advantages, and overall superiority of GAs. In subsequently presenting a basic optimization problem, *Genetic Algorithms and Investment Strategies* outlines the essential steps involved in using a GA and shows how it mimics nature's evolutionary process by moving quickly toward a near-optimal solution. Introduced to advanced variations of essential GA procedures, readers soon learn how GAs can be used to solve large, complex problems and smaller sets of problems. Serve the needs of traders with widely different investment philosophies. Develop sound market timing trading rules in the stock and bond markets. Select profitable individual stocks and bonds. Devise powerful portfolio management systems. Complete with information on relevant software programs, a glossary of GA terminology, and an extensive bibliography covering computerized approaches and market timing, *Genetic Algorithms and Investment Strategies* unveils in clear, non-technical language a remarkably efficient strategic decision-making process that when imaginatively used enables traders and investment analysts to reap significant financial rewards.

[Use of Genetic Algorithms for Optimal Investment Strategies](#) Fan Zhang, 2013 In this project, a genetic algorithm (GA) is used in the development of investment strategies to decide the optimum asset allocations that back up a portfolio of term insurance contracts and the re-balancing strategy to respond to the changing financial markets such as change in interest rates and mortality experience. The objective function used as the target to be maximized in GA allows us to accommodate three objectives that should be of interest to the management in insurance companies. The three objectives under consideration are maximizing the total value of wealth at the end of the period, minimizing the variance of the total value of the wealth across the simulated interest rate scenarios, and achieving consistent returns on the portfolio from year to year. One objective may be in conflict with another, and GA tries to find a solution among the large searching space of all the solutions that favors a particular objective as specified by the user while not worsening other objectives too much. Duration matching, a popular approach to manage risks underlying the traditional life insurance portfolios, is used as a benchmark to examine the effectiveness of the strategies obtained through the use of genetic algorithms. Experiments are conducted to compare the

performance of the investment strategy proposed by the genetic algorithm to the duration matching strategy in terms of the different objectives under the testing scenarios The results from the experiments successfully illustrate that with the help of GA we are able to find a strategy very similar to the strategy from duration matching We are also able to find other strategies that could outperform duration matching in terms of some of the desired objectives and are robust in the tested changing environment of interest rate and mortality Learning Classifier Systems in Data Mining Larry Bull,Ester

Integrated Soft Computing Dr. Jagadeesh Kumar,Badal Arya,2025-05-07 Soft computing is a kind of computing technology that we use to develop intelligent machines These machines have human like problem solving capabilities Later they offer imprecise but useful solutions for problems that are complex and even computational The technologies used in soft computing to address such complex problems include fuzzy logic neural network genetic algorithms and support vector machines Each of these techniques contributes in a unique way while addressing the problem Soft computing conducts the entire process in a cooperative way Integrated Soft Computing techniques are complementary to each other instead of being competitive while solving the problem This book offers the advantages in partnership with integrating soft computing to allow solutions for the problems that are otherwise unsolvable **Evolutionary Algorithms in Management**

Applications Jörg Biethahn,Volker Nissen,2012-12-06 Evolutionary Algorithms EA are powerful search and optimisation techniques inspired by the mechanisms of natural evolution They imitate on an abstract level biological principles such as a population based approach the inheritance of information the variation of information via crossover mutation and the selection of individuals based on fitness The most well known class of EA are Genetic Algorithms GA which have received much attention not only in the scientific community lately Other variants of EA in particular Genetic Programming Evolution Strategies and Evolutionary Programming are less popular though very powerful too Traditionally most practical applications of EA have appeared in the technical sector Management problems for a long time have been a rather neglected field of EA research This is surprising since the great potential of evolutionary approaches for the business and economics domain was recognised in pioneering publications quite a while ago John Holland for instance in his seminal book Adaptation in Natural and Artificial Systems The University of Michigan Press 1975 identified economics as one of the prime targets for a theory of adaptation as formalised in his reproductive plans later called Genetic Algorithms **Practical Applications of**

Intelligent Systems and Financial Forecasting Jason Kingdon, 2012-12-06

A fundamental objective of Artificial Intelligence AI is the creation of intelligent computer programs In more modest terms AI is simply concerned with expanding the repertoire of computer applications into new domains and to new levels of efficiency The motivation for this effort comes from many sources At a practical level there is always a demand for achieving things in more efficient ways Equally there is the technical challenge of building programs that allow a machine to do something a machine has never done before Both of these desires are contained within AI and both provide the inspirational force behind its development In terms of satisfying both of these desires there can be no better example than machine learning Machines that can learn have an in built efficiency The same software can be applied in many applications and in many circumstances The machine can adapt its behaviour so as to meet the demands of new or changing environments without the need for costly re programming In addition a machine that can learn can be applied in new domains with the genuine potential for innovation In this sense a machine that can learn can be applied in areas where little is known about possible causal relationships and even in circumstances where causal relationships are judged not to exist This last aspect is of major significance when considering machine learning as applied to financial forecasting
