Genetics Of Natural Populations The Continuing Importance Of Theodosius Dobzhansky:

Genetics of Natural Populations Louis Levine, 1995 A discussion of the life and work of Theodosius Dobzhansky and an assessment of the current research that has the origins in his findings and contributions **Genetics of Populations**,

Powell, 1997 The common fruitfly

Drosophila is the most extensively studied of all organisms in genetical research Thus it would appear to be the best model for achieving new insights Its use in evolutionary studies has resulted in an explosion of knowledge which has never before been gathered into a single volume This book spans the full range of evolutionary studies population genetics ecology ecological genetics speciation phylogenetics genome evolution molecular evolution and development In covering these topics

highlights of empirical research are emphasized and are put into the context of major issues in evolution Darwinism, Democracy, and Race John Jackson, David Depew, 2017-07-06 Cover Half Title Title Page Copyright Page Dedication Table of Contents Acknowledgments 1 Introduction in the footsteps of Franz Boas 2 Franz Boas and the argument from presumption 3 Demarcating anthropology the boundary work of Alfred Kroeber 4 Theodosius Dobzhansky and the argument from definition 5 Unifying science by creating community the epideictic rhetoric of Sherwood Washburn 6 A kairos moment unmet and met the controversy over Carleton Coon's *The Origin of Races* 7 Epilogue the roots of the Sociobiology controversy the infirmities of Evolutionary Psychology and the unity of anthropology Index Shaping Science with Rhetoric Leah Ceccarelli, 2010-11-15 How do scientists persuade colleagues from diverse fields to cross the disciplinary divide risking their careers in new interdisciplinary research programs Why do some attempts to inspire such research win widespread acclaim and support while others do not In *Shaping Science with Rhetoric* Leah Ceccarelli addresses such questions through close readings of three scientific monographs in their historical contexts Theodosius Dobzhansky's *Genetics and the Origin of Species* 1937 which inspired the modern synthesis of evolutionary biology Erwin Schrödinger's *What Is Life* 1944 which catalyzed the field of molecular biology and Edward O. Wilson's *Consilience* 1998 a so far not entirely successful attempt to unite the social and biological sciences She examines the rhetorical strategies used in each book and evaluates which worked best based on the reviews and scientific papers that followed in their wake Ceccarelli's work will be important for anyone interested in how interdisciplinary fields are formed from historians and rhetoricians of science to scientists themselves

The Dynamic Genome Antonio Fontdevila, 2011-06-02 These novelties among others are examined in this book in relation to their general significance for evolution emphasising their human relevance **The Adaptive Landscape in Evolutionary Biology** Erik I. Svensson, Ryan Calsbeek, 2012-05-17 The Adaptive Landscape has been a central concept in population genetics and evolutionary biology since this powerful metaphor was first formulated in 1932 This volume brings together historians of science philosophers ecologists and evolutionary biologists to discuss the state of the art from several different perspectives **Thinking about Evolution** Rama S. Singh, 2001 Originally published in 2001 this is the second of two volumes published by Cambridge University Press in honour of Richard Lewontin This second volume of essays honours the philosophical historical and political dimensions of his work It is fitting that the volume covers such a wide range of perspectives on modern biology given the range of Lewontin's own contributions He is not just a very successful practitioner of evolutionary genetics but a rigorous critic of the practices of genetics and evolutionary biology and an articulate analyst of the social political and economic contexts and consequences of genetic and evolutionary research The volume begins with an essay by Lewontin on *Natural History and Formalism in Evolutionary Genetics* and includes contributions by former students post docs colleagues and collaborators which cover issues ranging from the history and conceptual foundations of evolutionary biology and genetics to the implications of human genetic diversity **Endless Forms** Daniel J.

Howard, Stewart H. Berlocher, 1998 Speciation is one of the great themes of evolutionary biology It is the process through which new species are born and diversity generated Yet for many years our understanding of the process consisted of little more than a perception that if populations are isolated geographically they will diverge genetically and may come to form new species This situation began to change in the 1960s as an increasing number of biologists challenged the exclusivity of allopatric speciation and began to probe more deeply into the actual process by which divergence occurs and reproductive isolation is acquired This focus on process led to many new insights but numerous questions remain and speciation is now one of the most dynamic areas of research in modern evolutionary biology This volume presents the newest research findings on speciation bringing readers up to day on species concepts modes of speciation and the nature of reproductive barriers It also discusses the forces that drive divergence of populations the genetic control of reproductive isolation and the role played by hybrid zones and hybridization in speciation

Choosing Selection Stephen G. Brush, 2009 Describes the hypothesis that Darwin's natural selection reformulated by R A Fisher J B S Haldane and S Wright in the light of Mendelian genetics is the exclusive mechanism for biological evolution During the 1930s alternatives such as Lamarchism macromutations and orthogenesis were rejected in favor of natural selection acting on small mutations but there were disagreements about the role of random genetic drift in evolution By the 1950s research by T Dobzhansky E B Ford and others persuaded leading evolutionists that natural selection was so powerful that drift was unimportant This conclusion was accepted by most however some biology textbooks and popular articles mentioned drift in the late 1960s

Science in the Contemporary World Eric G. Swedin, 2005-03-08 This work is a unique introductory A Z resource detailing the scientific achievements of the contemporary world and analyzing the key scientific trends discoveries and personalities of the modern age An authoritative reference survey of the modern age of scientific discovery Science in the Contemporary World is a scholarly yet accessible chronicle of scientific achievement from the discovery of penicillin to the latest developments in space exploration and cloning Over 200 A Z entries cover the full spectrum of contemporary science with emphasis on its diverse nature Within the last 50 years medicine has eradicated the killer disease smallpox but primarily because the virus can live only in humans Space probes have revealed that on Europa a moon of Jupiter an ice capped ocean with the potential to support life probably exists Marvels from animal psychology and deep sea exploration are also explored extensively

The Evolution of Population Biology Rama S. Singh, Marcy K. Uyenoyama, 2004-01-15 This 2004 collection of essays deals with the foundation and historical development of population biology and its relationship to population genetics and population ecology on the one hand and to the rapidly growing fields of molecular quantitative genetics genomics and bioinformatics on the other Such an interdisciplinary treatment of population biology has never been attempted before The volume is set in a historical context but it has an up to date coverage of material in various related fields The areas covered are the foundation of population biology life history evolution and demography density and

frequency dependent selection recent advances in quantitative genetics and bioinformatics evolutionary case history of model organisms focusing on polymorphisms and selection mating system evolution and evolution in the hybrid zones and applied population biology including conservation infectious diseases and human diversity This is the third of three volumes published in honour of Richard Lewontin **Essays in Evolution and Genetics in Honor of Theodosius Dobzhansky** Max K. Hecht,2012-12-06 It is not often that one has the opportunity to send a public birthday greet ing to a friend and colleague of many years and to congratulate him on having reached the age of reason In fact it happens only once and comes then as a surprise Surely it was only a few years ago that we sat together at an International Genetics Congress in Ithaca and only yesterday that we became members of the same department The eighth floor of Schermerhorn Hall had a north end where the flies were and a south end furnished with mice and in between a seminar room and laboratory There the distances were short and the doors open and the coffee pot busy But it now appears that yesterday has fallen thirty years behind and that we have grown up I find it interesting and appropriate that Dobzhansky s lifetime spans the period of maturation of the fields to which this volume is devoted This is true in a chronological sense for his birth occurred in the same year 1900 in which modern genetics began The rediscovery of Mendel s princi ples and the interpretation of the nature of heredity and variation to which this event led were necessary prerequisites to the development of evolution ary biology as presented in this collection of essays Political Biology M. Meloni,2016-05-25 This book explores the socio political implications of human heredity from the second half of the nineteenth century to the present postgenomic moment It addresses three main phases in the politicization of heredity the peak of radical eugenics 1900 1945 characterized by an aggressive ethos of supporting the transformation of human society via biological knowledge the repositioning after 1945 of biological thinking into a liberal democratic human rights framework and the present postgenomic crisis in which the genome can no longer be understood as insulated from environmental signals In Political Biology Maurizio Meloni argues that thanks to the ascendancy of epigenetics we may be witnessing a return to soft heredity the idea that these signals can cause changes in biology that are themselves transferable to succeeding generations This book will be of great interest to scholars across science and technology studies the philosophy and history of science and political and social theory Haldane, Mayr, and Beanbag Genetics Krishna Dronamraju,2011-01-07 The book presents an account of the controversy between two great biologists J B S Haldane and Ernst Mayr regarding the significance of the mathematical contributions of the three pioneers J B S Haldane R A Fisher and S Wright to the theory of evolution The author is a former pupil of J B S Haldane Natural Selection Richard G. Delisle,2021-02-27 This book contests the general view that natural selection constitutes the explanatory core of evolutionary biology It invites the reader to consider an alternative view which favors a more complete and multidimensional interpretation It is common to present the 1930 1960 period as characterized by the rise of the Modern Synthesis an event structured around two main explanatory commitments 1 Gradual evolution is explained by small genetic

changes variations oriented by natural selection a process leading to adaptation 2 Evolutionary trends and speciation events are macroevolutionary phenomena that can be accounted for solely in terms of the extension of processes and mechanisms occurring at the previous microevolutionary level On this view natural selection holds a central explanatory role in evolutionary theory one that presumably reaches back to Charles Darwin's *Origin of Species* a view also accompanied by the belief that the field of evolutionary biology is organized around a profound divide theories relying on strong selective factors and those appealing only to weak ones If one reads the new analyses presented in this volume by biologists historians and philosophers this divide seems to be collapsing at a rapid pace opening an era dedicated to the search for a new paradigm for the development of evolutionary biology Contrary to popular belief scholars position on natural selection is not in itself a significant discriminatory factor between most evolutionists In fact the intellectual space is quite limited if not non-existent between on the one hand Darwinists who play down the central role of natural selection in evolutionary explanations and on the other hand non-Darwinists who use it in a list of other evolutionary mechanisms The mechanism-centered approach to evolutionary biology is too incomplete to fully make sense of its development In this book the labels created under the traditional historiography Darwinian Revolution Eclipse of Darwinism Modern Synthesis Post-Synthetic Developments are thus re-evaluated This book will not only appeal to researchers working in evolutionary biology but also to historians and philosophers
