W. Carus,Michael Friedman,Wolfgang Kienzler,Alan Richardson,Sven Schlotter,2019-06-25 Rudolf Carnap 1891 1970 is generally acknowledged to have been one of the central figures of twentieth century philosophy He was the leading philosopher of the Vienna Circle a group that was central to the international movement known as logical empiricism which pursued the goal of making philosophy scientific and eliminating metaphysics that went beyond the limits of what humans can coherently comprehend Carnap was not only well versed in this area of thought but also contrary ideas he interacted philosophically with Gottlob Frege Bertrand Russell Ludwig Wittgenstein Edmund Husserl and Martin Heidegger and in his formative years he was influenced by the positivists Mach and Ostwald neo Kantians such as Cassirer and Natorp and Husserl s phenomenology Interest in logical empiricism waned in the decades following Carnap s death but was revived towards the end of the twentieth century the wave of new scholarship that resulted identified Carnap as far more subtle and interesting than was previously understood The complete fourteen volume edition of Carnap s published writings builds upon these more recent interpretations of his philosophy This first book contains Carnap s early publications up until 1928 none of which have previously been translated from their original German The introduction and notes place the text in the relevant

Redefining Geometrical Exactness Henk J.M. Bos, 2012-12-06 In his *Geometry of 1637* Descartes achieved a monumental innovation of mathematical techniques by introducing what is now called analytic geometry Yet the key question of the book was foundational rather than technical When are geometrical objects known with such clarity and distinctness as befits the exact science of geometry Classically the answer was sought in procedures of geometrical construction in particular by ruler and compass but the introduction of new algebraic techniques made these procedures insufficient In this detailed study spanning essentially the period from the first printed edition of Pappus Collection 1588 in Latin translation and Descartes death in 1650 Bos explores the current ideas about construction and geometrical exactness noting that by the time Descartes entered the field the incursion of algebraic techniques combined with an increasing uncertainty about the proper means of geometrical problem solving had produced a certain impasse Hethen analyses how Descartes transformed geometry by a redefinition of exactness and by a demarcation of geometry's proper subject and procedures in such a way as to incorporate the use of algebraic methods without destroying the true nature of geometry Although mathematicians later essentially discarded Descartes methodological convictions his influence was profound and pervasive Bos insistence on the foundational aspects of the *Geometry* provides new insights both in the genesis of Descartes masterpiece and in its significance for the development of the conceptions of mathematical exactness
