## Geometry Symmetry:

Making Geometry Come Alive Alfred S. Posamentier, 2000-07-22 Activities in Geometry is a set of versatile enrichment exercises that covers a very broad range of topics in geometry Euclidean post Euclidean and non Euclidean Several criteria have been used in developing the activities and in selecting the topics that are included All of them bear heavily and equally on our concerns for curriculum goals and classroom management Each activity is presented as a reproducible student investigation It is followed by guidelines and notes for the teacher Each activity is keyed to the National Council of Teachers of Mathematics NCTM Standards Revised This link to the NCTM standards allows teachers to facilitate linking classroom activities to specific state and school district content standards First and foremost the activities are meant to be motivational As much as possible we want this book to achieve the goal of being attractive to students and show them that there is much more to geometry than proving theorems To demonstrate this aspect of geometry it is necessary for the investigation to be quite different from what students encounter in their basal texts different in both substance and form Presenting activities on a regular basis gives the variety and change of pace needed to sustain interest in any subject Transformation Geometry

George E. Martin, 2012-12-06 Transformation geometry is a relatively recent expression of the successful venture of bringing together geometry and algebra The name describes an approach as much as the content Our subject is Euclidean geometry Essential to the study of the plane or any mathematical system is an understanding of the transformations on that system that preserve designated features of the system Our study of the automorphisms of the plane and of space is based on only the most elementary high school geometry In particular group theory is not a prerequisite here On the contrary this modern approach to Euclidean geometry gives the concrete examples that are necessary to appreciate an introduction to group theory Therefore a course based on this text is an excellent prerequisite to the standard course in abstract algebra taken by every undergraduate mathematics major An advantage of having no college mathematics prerequisite to our study is that the text is then useful for graduate mathematics courses designed for secondary teachers Many of the students in these classes either have never taken linear algebra or else have taken it too long ago to recall even the basic ideas It turns out that very little is lost here by not assuming linear algebra A preliminary version of the text was written for and used in two courses one was a graduate course for teachers and the other a sophomore course designed for the prospective teacher and the general mathematics major taking one course in geometry *Math Dimensions: An Interactive Journey Through Geometry,*
