Multi-Carrier and Spread Spectrum Systems K. Fazel, S. Kaiser, 2004-02-06. Frequency spectrum is a limited and valuable resource for wireless communications. A good example can be observed among network operators in Europe for the prices to pay for UMTS frequency bands. Therefore the first goal when designing future wireless communication systems, e.g. 4G, fourth generation, has to be the increase in spectral efficiency. The development in digital communications in the past years has enabled efficient modulation and coding techniques for robust and spectral efficient data, speech, audio and video transmission. These are the multi carrier modulation, e.g. OFDM, and the spread spectrum technique, e.g. DS-SS CDMA, where OFDM was chosen for broadcast applications, DVB, DAB, as well as for broadband wireless indoor standards, ETSI HIPERLAN II, IEEE 802.11, and the DS-SS CDMA was selected in mobile communications, IS-95, third generation mobile radio systems, world wide UMTS, IMT-2000. Since 1993 various combinations of multi carrier MC modulation and the spread spectrum SS technique have been introduced and the field of MC-SS communications has become an independent and important research topic with increasing activities. New application fields have been proposed such as high rate cellular mobile, high rate wireless indoor and LMDS. It has been shown that MC-SS offers the high spectral efficiency, robustness and flexibility that is

required for the next generation systems Meanwhile different alternative hybrid schemes such as OFDM OFDMA MC TDMA etc have been deeply analysed and adopted in different international standards ETSI BRAN IEEE 802 MMAC Multi Carrier Spread Spectrum Analysis of Hybrid Air Interfaces draws together all of the above mentioned hybrid schemes therefore providing a greatly needed resource for system engineers telecommunication designers and researchers in order to enable them to develop build and deploy several schemes based on MC transmission for the next generation systems which will be an integration of broadband multimedia services covering both 4G mobile and fixed wireless systems Offers a complete treatment of multi carrier spread spectrum SS and time division multiplexing TDM techniques Provides an in depth insight into hybrid multiple access techniques based on multi carrier MC transmission Presents numerous hybrid multiple access and air interface architectures including OFDM CDMA MC CDMA MC DS CDMA and MT CDMA Covers new techniques such as space time coding and software radio Telecommunications engineers hardware software system designers and researchers as well as students lecturers and technicians will all find this an invaluable addition to their bookshelf
