Genetic Improvement of Crops, 1980 **Genetic Improvement of Crops** Irwin Rubenstein, 1980 *Somatic Hybridization in Crop Improvement II* Toshiyuki Nagata, Y.P.S. Bajaj, 2001-07-17 Somatic hybrids through the fusion of plant protoplasts have widened the genetic variability of cultivated plants As *Somatic Hybridization in Crop Improvement I* published in 1994 this volume describes how this discipline can contribute to the improvement of crops It comprises 24 chapters dealing with interspecific and intergeneric somatic hybridization and cybridization It is divided into four sections I Cereals Barley rice and wheat II Vegetables and Fruits Arabidopsis Asparagus Brassica chicory Citrus Cucumis Diospyros Ipomoea and various Solanaceous species e g tomato potato and eggplant III Medicinal and Aromatic Plants Atropa Dianthus Nicotiana and Senecio IV Legumes Pasture Crops Alfalfa This book is tailored to the needs of advanced students teachers and researchers in the fields of plant breeding genetic engineering and plant tissue culture **Genetic improvement of crops** Irwin Rubenstein, 1980 **Applications of Genetic Engineering to Crop Improvement** G.B. Collins, Joseph F. Petolino, 2012-12-06 The contributions of plant genetics to the production of higher yielding crops of superior quality are well documented These successes have been realized through the application of plant breeding techniques to a diverse array of genetically controlled traits Such highly effective breeding procedures will continue to be the primary method employed for the development of new crop cultivars however new techniques in cell and molecular biology will provide additional approaches for genetic modification There has been considerable speculation recently concerning the potential impact of new techniques in cell and molecular biology on plant improvement These genetic engineering techniques should offer unique opportunities to alter the genetic makeup of crops if applied to existing breeding procedures Many questions must be answered in order to identify specific applications of these new technologies This search for applications will require input from plant scientists working on various aspects of crop improvement This volume is intended to assess the interrelationships between conventional plant breeding and genetic engineering *Somaclonal Variations and Crop Improvement* J. Semal, 2013-04-17 Proceedings of a Seminar in the CEC Programme of the Coordination of Research on Plant Protein Improvement held in Gembloux Belgium Sept 3 5 1985 **Somaclonal Variation in Crop Improvement I** Professor Dr. Y. P. S. Bajaj, 2013-03-14 Methods for Plant Molecular Biology Arthur Weissbach, Herbert Weissbach, 2013-09-24 *Methods for Plant Molecular Biology* is a collection of articles that focuses on the techniques used in plant molecular biology and genetics The book discusses the isolation and characterization of nuclear chloroplast and mitochondrial nucleic acids and the factors and systems involved in transcription and gene expression Procedures for the isolation of cell walls chloroplast membranes membrane proteins techniques to carry out plant cell culture and protoplast formation and methods for gene and organelle transfer are covered as well Biologists molecular biologists botanists and students will find the book very useful Gene Manipulation in Plant Improvement J. Perry Gustafson, 2012-12-06 The results obtained to date involving the use of

in methods to facilitate wide hybridization in plants are voluminous and impressive. The techniques of embryo culture, ovule culture and in pollination and fertilization represent an extension of the normal sexual hybridization process. Successes recorded in obtaining hybrids stem largely from circumventing prezygotic or postzygotic hybridization barriers. Numerous recent successful hybridizations were possible because of the development of improved tissue and cell culture systems for crop plants and attention given to genotypes used in hybridization attempts. Interspecific and intergeneric hybridization utilizing the process of protoplast fusion will bypass the limits set by all sexual methods. In addition to combining complete genomes from two different species through protoplast fusion, this system affords unique opportunities for creating novel cytoplasmic combinations, transfer of individual chromosomes, transfer of cytoplasmic organelles, manipulation of male sterility and for single gene transfer. Some caution must be noted with regard to the extent of hybridization possible between distantly related species. Although practically no limit exists to the physical fusion of protoplasts from widely divergent species, the restrictions imposed by somatic incompatibility have not been adequately addressed. Regeneration of plants from the protoplast or single heterokaryon level is still a major hurdle for many important crop species before somatic cell fusion can be exploited to produce interspecific and intergeneric hybrids. Identification and selection of hybrids is also a limitation to the efficient application of cell fusion methods.

Production and Utilization of Protein in Oilseed Crops E.S. Bunting, 2012-12-06. This publication contains the proceedings of a seminar on Production and Utilization of Protein in Oilseed Crops held at Braunschweig from 8 to 10 July 1980. The meeting was held under the auspices of the Commission of the European Communities as part of the EEC Common Research Programme on Plant Protein Improvement. Methods for the intensive production of meat and milk have been adopted to an increasing extent in EEC countries over the past two decades; their success is based on animal diets of high quality balanced for energy and protein contents. The substantial improvements in cereal yields in EEC over this period have kept pace with the increasing demand for dietary energy in concentrated animal foodstuffs, but provision of the necessary protein supplementation has required ever increasing imports of soybean products. Grain legumes and oilseed meals are the two main sources of concentrated protein for the animal feeds industry and there is an urgent need for increased EEC production of both. Seminars on grain legumes have been held at regular intervals since 1976; the meeting at Braunschweig now reported was the first to consider in detail the potential contribution from oilseed crops suitable for EEC conditions. Local arrangements for the seminar were made by Professor Dr M. Dambroth, Dr C. Sommer and their colleagues at the Institut für Pflanzenbau und Pflanzenzüchtung, Braunschweig.

Wilson, 2012-12-06 William C Taylor Department of Genetics University of California Berkeley California 94720 It is evident by now that there is a great deal of interest in exploiting the new technologies to genetically engineer new forms of plants A purpose of this meeting is to assess the possibilities The papers that follow are concerned with the analysis of single genes or small gene families We will read about genes found within the nucleus plastids and bacteria which are responsible for agriculturally important traits Given that these genes can be isolated by recombinant DNA techniques there are two possible strategies for plant engineering One involves isolating a gene from a cultivated plant changing it in a specific way and then inserting it back into the same plant where it produces an altered gene product An example might be changing the amino acid composition of a seed protein so as to make the seed a more efficient food source A second strategy is to isolate a gene from one species and transfer it to another species where it produces a desirable feature An example might be the transfer of a gene which encodes a more efficient photosynthetic enzyme from a wild relative into a cultivated species There are three technical hurdles which must be overcome for either strategy to work The gene of interest must be physically isolated
