Genetics Of Subpolar Fish And Invertebrates:

Genetics of Subpolar Fish and Invertebrates Anthony J. Gharrett, Richard G. Gustafson, Jennifer L. Nielsen, James E. Seeb, Lisa W. Seeb, William W. Smoker, Gary H. Thorgaard, Richard L. Wilmot, 2012-12-06 Fisheries genetics researchers will find invaluable the thirty eight peer reviewed contributions in this book presented at the 20th Lowell Wakefield Fisheries Symposium Genetics of Subpolar Fish and Invertebrates held in May 2002 in Juneau Alaska Looming over concerns of lost fisheries stocks and persistent erosion of genetic variability are predictions of global warming which may further tax genetic resources One consequence is an increased reliance on genetic applications to many aspects of fisheries management aquaculture and conservation The contributions in this book are important to modern fisheries science and genetics and illustrate the evolution of the field over the past decade The improved technology provides tools to address increasingly complicated problems in traditional applications and ecological and behavioral studies The union between molecular and quantitative genetics where many of the major questions about population structure and evolution remain unanswered will also benefit from the new technologies **Genetics of Subpolar Fish and Invertebrates**, 2004 *Genomics in Aquaculture to Better Understand Species Biology and Accelerate Genetic Progress* José Manuel Yáñez, Ross Houston, Scott Newman, 2016-09-15 From a global perspective aquaculture is an activity related to food production with large potential for growth Considering a continuously growing population the efficiency and sustainability of this activity will be crucial to meet the needs of protein for human consumption in the near future However for continuous enhancement of the culture of both fish and shellfish there are still challenges to overcome mostly related to the biology of the cultured species and their interaction with increasingly changing environmental factors Examples of these challenges include early sexual maturation feed meal replacement immune response to infectious diseases and parasites and temperature and salinity tolerance Moreover it is estimated that less than 10% of the total aquaculture production in the world is based on populations genetically improved by means of artificial selection Thus there is considerable room for implementing breeding schemes aimed at improving productive traits having significant economic impact By far the most economically relevant trait is growth rate which can be efficiently improved by conventional genetic selection i e based on breeding values of selection candidates However there are other important traits that cannot be measured directly on selection candidates such as resistance against infectious and parasitic agents and carcass quality traits e g fillet yield and meat color However these traits can be more efficiently improved using molecular tools to assist breeding programs by means of marker assisted selection using a few markers explaining a high proportion of the trait variation or genomic selection using thousands of markers to estimate genomic breeding values The development and implementation of new technologies applied to molecular biology and genomics such as next generation sequencing methods and high throughput genotyping platforms are allowing the rapid increase of availability of genomic resources in aquaculture species These resources will provide powerful tools to the

research community and will aid in the determination of the genetic factors involved in several biological aspects of aquaculture species. In this regard, it is important to establish discussion in terms of which strategies will be more efficient to solve the primary challenges that are affecting aquaculture systems around the world. The main objective of this Research Topic is to provide a forum to communicate recent research and implementation strategies in the use of genomics in aquaculture species with emphasis on 1) a better understanding of fish and shellfish biological processes having considerable impact on aquaculture systems and 2) the efficient incorporation of molecular information into breeding programs to accelerate genetic progress of economically relevant traits.

Evolutionary Theory and Processes: Modern Horizons

Solomon P. Wasser, 2013-03-09. Evolution is the most profound of human ideas integrating all natural phenomena: cosmic, biological, and cultural into a continuous universal change. This volume deals with evolutionary observations, experiments, and theories contributing to a deeper understanding of the evolutionary process, honoring the 75th birthday of Eviatar Elinor. I first met Elinor in 1966 when he was a Fellow in the Museum of Comparative Zoology at Harvard University and working mostly on cricket frog vocalization and speciation in the United States. His unique discovery of pipid fossil frogs in the Israeli Early Cretaceous central Negev is possibly the largest world collection of ancient fossil frogs. Our acquaintance developed into mutual friendship and admiration. Since then, our long-lasting friendship has included a visit to Israel, enabling me to follow Elinor's major scientific achievements, in particular his founding of the Institute of Evolution in the University of Haifa and now the pending establishment of the International Graduate School of Evolution. The research program of Elinor Nevo, in collaboration with numerous colleagues and students in Israel and across the world, encompasses diverse perspectives of evolutionary biology and biodiversity of genes, populations, species, and ecosystems, integrating modern and classical evolutionary approaches: molecular and organismal. They deal with model organisms in all forms, from bacteria through plants, fungi, animals, and humans, conducted over local, regional, and global scales.

The Physiology of Polar Fishes Anthony Peter Farrell,John F. Steffensen,2005 Devoted to fishes of high latitudes Arctic and Antarctic This book includes themes such as the uniqueness of the physiology of fishes that live in cold polar environments an analysis of physiological patterns exemplified by fishes that live poles apart and how fishes differ from fishes living in more temperate and tropical habitats

Ecology of Marine Zooplankton and Micronekton in Polar and Sub-Polar Areas Letterio Guglielmo,Alessandro Bergamasco,Guang Yang ,Antonia Granata,2024-11-01 The Polar and Subpolar region comprise one of the seven regions in the world from the Arctic to the Antarctic the Atlantic Pacific and Indian Oceans Marine biodiversity in the polar and subpolar regions is one of the richest on earth hosting important populations of crustaceans pelagic and benthic species that provide resources for the many seabirds and marine mammals that congregate there However these ecosystems as well as their biodiversity are vulnerable and already affected by the impacts of climate change and other threats The high climatic dynamics in those areas have already generated strong modifications to the environment with irreversible losses in biodiversity and diminished ecosystem services that are essential for the whole planet The current need to study and understand the biodiversity of the world s oceans makes polar and sub polar areas key regions for taxonomic and ecological studies 20th Lowell Wakefield Symposium Brenda Baxter,Alaska Sea Grant College Program,2002*

Adaptation and Evolution in Marine Environments, Volume 2 Cinzia Verde,Guido di Prisco,2012-10-29 The second volume of Adaptation and Evolution in Marine Environments The Impacts of Global Change on Biodiversity from the series From Pole to Pole integrates the marine biology contribution of the first tome to the IPY 2007 2009 presenting overviews of organisms from bacteria and ciliates to higher vertebrates thriving on polar continental shelves slopes and deep sea The speed and extent of warming in the Arctic and in regions of Antarctica the Peninsula at the present are greater than elsewhere Changes impact several parameters in particular the extent of sea ice organisms ecosystems and communities that became finely adapted to increasing cold in the course of millions of years are now becoming vulnerable and biodiversity is threatened Investigating evolutionary adaptations helps to foresee the impact of changes in temperate areas highlighting the invaluable contribution of polar marine research to present and future outcomes of the IPY in the Earth system scenario **Atlantic Salmon in Maine** National Research Council,Division on Earth and Life Studies,Ocean Studies Board,Board on Environmental Studies and Toxicology,Committee on Atlantic Salmon in Maine,2004-10-07 Because of the pervasive and substantial decline of Atlantic salmon populations in Maine over the past 150 years and because they are close to extinction a comprehensive statewide action should be taken now to ensure their survival The populations of Atlantic salmon have declined drastically from an estimated half million adult salmon returning to U S rivers each year in the early 1800s to perhaps as few as 1 000 in 2001 The report recommends implementing a formalized decision making approach to establish

priorities evaluate options and coordinate plans for conserving and restoring the salmon Effects of Climate Change Across Ocean Regions Ove Hoegh-Guldberg, Elvira S. Poloczanska, 2018-07-05 The IPCC Fifth Assessment Report AR5 highlighted that conditions within Earth's ocean are changing more rapidly than any of the time during the past 65 million years and as a consequence major changes are occurring in natural and human systems While this major report has enhanced our understanding of the complexity of ocean issues we propose this research topic as an opportunity to expand discussion on past present and future changes across oceans regions
