Asymptotic Behaviour of Linearly Transformed Sums of Random Variables V.V. Buldygin, Serguei

Solntsev, 2012-12-06 Limit theorems for random sequences may conventionally be divided into two large parts: one of them dealing with convergence of distributions (weak limit theorems) and the other with almost sure convergence (that is to say with asymptotic properties of almost all sample paths of the sequences involved) (strong limit theorems). Although either of these directions is closely related to another one, each of them has its own range of specific problems as well as the own methodology for solving the underlying problems. This book is devoted to the second of the above mentioned lines, which means that we study asymptotic behaviour of almost all sample paths of linearly transformed sums of independent random variables (vectors and elements taking values in topological vector spaces). In the classical works of P. Levy, A. Ya. Khintchine, A. N. Kolmogorov, P. Hartman, A. Wintner, W. Feller, Yu. V. Prokhorov and M. Loeve the theory of almost sure asymptotic behaviour of increasing scalar normed sums of independent random variables was constructed. This theory not only provides conditions of the almost sure convergence of series of independent random variables but also studies different versions of the strong law

of large numbers and the law of the iterated logarithm One should point out that even in this traditional framework there are still problems which remain open while many definitive results have been obtained quite recently

Random Fields and Stochastic Partial Differential Equations Y. Rozanov, 1998-03-31 This book considers some models described by means of partial differential equations and boundary conditions with chaotic stochastic disturbance In a framework of stochastic Partial Differential Equations an approach is suggested to generalize solutions of stochastic Boundary Problems The main topic concerns probabilistic aspects with applications to well known Random Fields models which are representative for the corresponding stochastic Sobolev spaces The term stochastic in general indicates involvement of appropriate random elements It assumes certain knowledge in general Analysis and Probability Hilbert space methods Schwartz distributions Fourier transform I A very general description of the main problems considered can be given as follows Suppose we are considering a random field in a region $T \subset \mathbb{R}^d$ which is associated with a chaotic stochastic source by means of the differential equation in T A typical chaotic source can be represented by an appropriate random field with independent values i.e. generalized random function $\varphi_p(T)$ $\varphi_p \in C(T)$ with independent random variables $\varphi_p(f_j)$ for any test functions φ_p with disjoint supports The property of having independent values implies a certain roughness of the random field which can only be treated functionally as a very irregular Schwarz distribution With the lack of a proper development of non linear analyses for generalized functions let us limit ourselves to the 1 For related material see for example J L Lions E

Non-Asymptotic Analysis of Approximations for Multivariate Statistics Yasunori Fujikoshi, Vladimir V. Ulyanov, 2020-06-28 This book presents recent non

asymptotic results for approximations in multivariate statistical analysis The book is unique in its focus on results with the correct error structure for all the parameters involved Firstly it discusses the computable error bounds on correlation coefficients MANOVA tests and discriminant functions studied in recent papers It then introduces new areas of research in high dimensional approximations for bootstrap procedures Cornish Fisher expansions power divergence statistics and approximations of statistics based on observations with random sample size Lastly it proposes a general approach for the construction of non asymptotic bounds providing relevant examples for several complicated statistics It is a valuable resource for researchers with a basic understanding of multivariate statistics *Probability and Stochastic Modeling* Vladimir I.
