

Internetworking

The concept of interconnecting different types of networks to build a large, global network is the core idea of the Internet and is often referred to as internetworking.

Devices that interconnect links of the same type are called as switches.

Particularly class of L2 switches in use today are those used to interconnect Ethernet segments. These switches are also sometimes called bridges.

Routers are devices that connect multiple computer network together and route data packets between them.

Routers are essential for directing internet traffic and enabling communication between devices on different networks.

Switching and Bridging

A switch is a mechanism that allows us to interconnect links to form a larger network. A switch is a multi-input, multi-output device that transfers packets from an input to one or more outputs. Thus, a switch adds the star topology to the set of possible network structures.

Properties of star topology

- A switch has a fixed number of inputs and outputs, which limits the number of hosts that can be connected to a single switch, large networks can be built by interconnecting a number of switches.
- We can connect switches to each other and to hosts using point-to-point links, which typically means that we can build networks of large geographic scope.
- Adding a new host to the network by connecting it to a switch does not necessarily reduce the performance of the network for other hosts already connected.

A star topology

A switch is connected to a set of links and, for each of these links, runs the appropriate data link protocol to communicate with the node at the other end of the link. A switch's primary job is to receive incoming packets on one of its links and to transmit them on some other link. This function is sometimes referred to as either *switching* or *forwarding*.
