Feasible Mathematics II Progress In Computer Science And Applied Logic Volume 13:

Feasible Mathematics II Peter Clote, Jeffrey B. Remmel, 2013-03-13 Perspicuity is part of proof If the process by means of which I get a result were not surveyable I might indeed make a note that this number is what comes out but what fact is this supposed to confirm for me I don't know what is supposed to come out 1 L Wittgenstein A feasible computation uses small resources on an abstract computation device such as a Turing machine or boolean circuit Feasible mathematics concerns the study of feasible computations using combinatorics and logic as well as the study of feasibly presented mathematical structures such as groups algebras and so on This volume contains contributions to feasible mathematics in three areas computational complexity theory proof theory and algebra with substantial overlap between different fields In computational complexity theory the polynomial time hierarchy is characterized without the introduction of runtime bounds by the closure of certain initial functions under safe composition predicative recursion on notation and unbounded minimization S Bellantoni an alternative way of looking at NP problems is introduced which focuses on which parameters of the problem are the cause of its computational complexity and completeness density and separation collapse results are given for a structure theory for parametrized problems R Downey and M Fellows new characterizations of PTIME and LINEAR SPACE are given using predicative recurrence over all finite tiers of certain stratified free algebras D Kurt Gödel: *Collected Works: Volume IV* Kurt Gödel, 2013-10 Kurt Gödel 1906-1978 was the most outstanding logician of the twentieth century These collected works form the only comprehensive edition of Gödel's work available and are designed to be useful and accessible to as wide an audience as possible without sacrificing scientific or historical accuracy **Graph-Theoretic Concepts in Computer Science** Daniël Paulusma, Bernard Ries, 2023-09-22 This volume constitutes the thoroughly refereed proceedings of the 49th International Workshop on Graph Theoretic Concepts in Computer Science WG 2023 The 33 full papers presented in this volume were carefully reviewed and selected from a total of 116 submissions The WG 2022 workshop aims to merge theory and practice by demonstrating how concepts from graph theory can be applied to various areas in computer science or by extracting new graph theoretic problems from applications *Developments in Language Theory* Werner Kuich, Grzegorz Rozenberg, Arto Salomaa, 2003-07-31 This book constitutes the thoroughly refereed post proceedings of the 5th International Conference on Developments in Language Theory DLT 2001 held in Vienna Austria in July 2001 The 24 revised full papers presented together with 10 revised invited papers were carefully selected during two rounds of reviewing and revision from a total of 64 papers submitted Among the topics covered are grammars and acceptors efficient algorithms for languages combinatorial and algebraic properties decision problems relations to complexity theory logic picture description and analysis DNA computing cryptography and concurrency **Foundations of Software Technology and Theoretical Computer Science** Vijay Chandru, 1996-11-27 This book constitutes the refereed proceedings of the 16th International Conference on Foundations of Software Technology and Theoretical Computer Science FST also included are four invited

contributions The papers are organized in topical sections on computational geometry process algebras program semantics algorithms rewriting and equational temporal logics complexity theory and type theory *Kurt Gödel: Collected Works: Volume V* Kurt Gödel, 2013-10 Kurt Gödel 1906-1978 was the most outstanding logician of the twentieth century These collected works form the only comprehensive edition of Gödel's work available and are designed to be useful and accessible to as wide an audience as possible without sacrificing scientific or historical accuracy **Handbook of Practical Logic and Automated Reasoning** John Harrison, 2009-03-12 A one stop reference self contained with theoretical topics presented in conjunction with implementations for which code is supplied **Automata, Languages and Programming** Josep Díaz, 2004-08-17 This book constitutes the refereed proceedings of the 31st International Colloquium on Automata Languages and Programming ICALP 2004 held in Turku Finland in July 2004 The 97 revised full papers presented together with abstracts of 6 invited talks were carefully reviewed and selected from 379 submissions The papers address all current issues in theoretical computer science including algorithms automata complexity cryptography database logics program semantics and programming theory **Logic of Computation** Helmut Schwichtenberg, 2012-12-06 The Marktoberdorf Summer School 1995 Logic of Computation was the 16th in a series of Advanced Study Institutes under the sponsorship of the NATO Scientific Affairs Division held in Marktoberdorf Its scientific goal was to survey recent progress on the impact of logical methods in software development The courses dealt with many different aspects of this interplay where major progress has been made Of particular importance were the following The proofs as programs paradigm which makes it possible to extract verified programs directly from proofs Here a higher order logic or type theoretic setup of the underlying language has developed into a standard Extensions of logic programming e.g. by allowing more general formulas and or higher order languages Proof theoretic methods which provide tools to deal with questions of feasibility of computations and also to develop a general mathematical understanding of complexity questions Rewrite systems and unification again in a higher order context Closely related is the now well established Gräbner basis theory which recently has found interesting applications Category theoretic and more generally algebraic methods and techniques to analyze the semantics of programming languages All these issues were covered by a team of leading researchers Their courses were grouped under the following headings *Hilbert's Programs and Beyond* Wilfried Sieg, 2013-01-24 Hilbert's Programs Beyond presents the foundational work of David Hilbert in a sequence of thematically organized essays They first trace the roots of Hilbert's work to the radical transformation of mathematics in the 19th century and bring out his pivotal role in creating mathematical logic and proof theory They then analyze techniques and results of classical proof theory as well as their dramatic expansion in modern proof theory This intellectual experience finally opens horizons for reflection on the nature of mathematics in the 21st century Sieg articulates his position of reductive structuralism and explores mathematical capacities via computational models *Foundational and Practical Aspects of Resource Analysis* Ugo Dal Lago, Ricardo Peña, 2014-10-21 This book

constitutes the proceedings of the Third International Workshop on Foundational and Practical Aspects of Resource Analysis FOPARA 2013 held in Bertinoro Italy in August 2013 The 9 papers presented in this volume were carefully reviewed and selected from 12 submissions They deal with traditional approaches to complexity analysis differential privacy and probabilistic analysis of programs *Handbook of Proof Theory* S.R. Buss, 1998-07-09 This volume contains articles covering a broad spectrum of proof theory with an emphasis on its mathematical aspects The articles should not only be interesting to specialists of proof theory but should also be accessible to a diverse audience including logicians mathematicians computer scientists and philosophers Many of the central topics of proof theory have been included in a self contained expository of articles covered in great detail and depth The chapters are arranged so that the two introductory articles come first these are then followed by articles from core classical areas of proof theory the handbook concludes with articles that deal with topics closely related to computer science **Boolean Functions and Computation Models** Peter Clote, Evangelos

Kranakis, 2013-03-09 The foundations of computational complexity theory go back to Alan Turing in the 1930s who was concerned with the existence of automatic procedures deciding the validity of mathematical statements The first example of such a problem was the undecidability of the Halting Problem which is essentially the question of debugging a computer program Will a given program eventually halt Computational complexity today addresses the quantitative aspects of the solutions obtained Is the problem to be solved tractable But how does one measure the intractability of computation Several ideas were proposed A Cobham Cob65 raised the question of what is the right model in order to measure a computation step M Rabin Rab60 proposed the introduction of axioms that a complexity measure should satisfy and C Shannon Sha49 suggested the boolean circuit that computes a boolean function However an important question remains What is the nature of computation In 1957 John von Neumann vN58 wrote in his notes for the Silliman Lectures concerning the nature of computation and the human brain that logics and statistics should be primarily although not exclusively viewed as the basic tools of information theory Also that body of experience which has grown up around the planning evaluating and coding of complicated logical and mathematical automata will be the focus of much of this information theory The most typical but not the only such automata are of course the large electronic computing machines **Cryptography and Security in**

Computing Jaydip Sen, 2012-03-07 The purpose of this book is to present some of the critical security challenges in today's computing world and to discuss mechanisms for defending against those attacks by using classical and modern approaches of cryptography and other defence mechanisms It contains eleven chapters which are divided into two parts The chapters in Part 1 of the book mostly deal with theoretical and fundamental aspects of cryptography The chapters in Part 2 on the other hand discuss various applications of cryptographic protocols and techniques in designing computing and network security solutions The book will be useful for researchers engineers graduate and doctoral students working in cryptography and security related areas It will also be useful for faculty members of graduate schools and universities *Automata,*

Languages and Programming Friedhelm Meyer auf der Heide, Burkhard Monien, 1996-06-26 This volume constitutes the refereed proceedings of the 23rd International Colloquium on Automata Languages and Programming ICALP 96 held at Paderborn Germany in July 1996 ICALP is an annual conference sponsored by the European Association on Theoretical Computer Science EATCS The proceedings contain 52 refereed papers selected from 172 submissions and 4 invited papers The papers cover the whole range of theoretical computer science they are organized in sections on Process Theory Fairness Domination and the μ Calculus Logic and Algebra Languages and Processes Algebraic Complexity Graph Algorithms Automata Complexity Theory Combinatorics on Words Algorithms Lower Bounds Data Structures **Cryptographic**

Applications of Analytic Number Theory Igor Shparlinski, 2013-03-07 The book introduces new techniques that imply rigorous lower bounds on the complexity of some number theoretic and cryptographic problems It also establishes certain attractive pseudorandom properties of various cryptographic primitives These methods and techniques are based on bounds of character sums and numbers of solutions of some polynomial equations over finite fields and residue rings Other number theoretic techniques such as sieve methods and lattice reduction algorithms are used as well The book also contains a number of open problems and proposals for further research The emphasis is on obtaining unconditional rigorously proved statements The bright side of this approach is that the results do not depend on any assumptions or conjectures On the downside the results are much weaker than those which are widely believed to be true We obtain several lower bounds exponential in terms of $\log p$ on the degrees and orders of o polynomials o algebraic functions o Boolean functions o linear recurrence sequences coinciding with values of the discrete logarithm modulo a prime p at sufficiently many points the number of points can be as small as $p^{1/2}$ O These functions are considered over the residue ring modulo p and over the residue ring modulo an arbitrary divisor d of $p-1$ The case of $d=2$ is of special interest since it corresponds to the representation of the rightmost bit of the discrete logarithm and defines whether the argument is a quadratic residue

Logical Approaches to Computational Barriers Arnold Beckmann, Ulrich Berger, Benedikt Löwe, John V. Tucker, 2006-06-29 This book constitutes the refereed proceedings of the Second International Conference on Computability in Europe CiE 2006 held in Swansea UK June July 2006 The book presents 31 revised full papers together with 30 invited papers including papers corresponding to 8 plenary talks and 6 special sessions on proofs and computation computable analysis challenges in complexity foundations of programming mathematical models of computers and hypercomputers and Gödel's centenary Gödel's legacy for computability **ACM Transactions on Computational Logic**, 2010 **Coding, Cryptography and**

Combinatorics Keqin Feng, Harald Niederreiter, Chaoping Xing, 2004-06-25 It has long been recognized that there are fascinating connections between coding theory cryptology and combinatorics Therefore it seemed desirable to us to organize a conference that brings together experts from these three areas for a fruitful exchange of ideas We decided on a venue in the Huang Shan Yellow Mountain region one of the most scenic areas of China so as to provide the additional inducement of

an attractive location The conference was planned for June 2003 with the official title Workshop on Coding Cryptography and Combinatorics CCC 2003 Those who are familiar with events in East Asia in the first half of 2003 can guess what happened in the end namely the conference had to be cancelled in the interest of the health of the participants The SARS epidemic posed too serious a threat At the time of the cancellation the organization of the conference was at an advanced stage all invited speakers had been selected and all abstracts of contributed talks had been screened by the program committee Thus it was decided to call on all invited speakers and presenters of accepted contributed talks to submit their manuscripts for publication in the present volume Altogether 39 submissions were received and subjected to another round of refereeing After careful scrutiny 28 papers were accepted for publication *Automata, Languages and Programming* ,2004
