Probabilistic operator theory is the branch of probabilistic analysis which is concerned with the study of operator-valued random variables and their properties. The development of a theory of random operators is of interest in its own right as a probabilistic generalization of (deterministic) operator theory and just as operator theory is of fundamental importance in the study of operator equations, the development of probabilistic operator theory is required for the study of various classes of random equations.

Definition 1.1 Any $\aleph$-valued random variable $x(\omega)$ which satisfies the condition $\{\omega \in T : x(\omega) = p(\omega)\}$ is said to be a random solution of the random operator equation $T(\omega) x(\omega) = p(\omega)$.

Definition 1.2 An $\aleph$-valued random variable $x(\omega)$ is said to be a fixed point of the random operator $T(\omega)$ if $x(\omega)$ is a random solution of the equation $T(\omega) x(\omega) = x(\omega)$.

The study of fixed point theorems for random operators was initiated by Spaček and Hanš. The first systematic investigation of random fixed point theorems was carried out by Hanš. Because of the wide applicability of Banach's contraction mapping theorem in the study of deterministic operator equations, Spaček and Hanš directed their attention to probabilistic versions of Banach's theorem and used their results to prove the existence, uniqueness, and measurability of solutions of integral equations with random kernels.

Definition 1.3 (A random operator $T(\omega)$ on a Banach space $\aleph$ with domain $D(T(\omega))$ is said to be a random contraction operator if there exists a nonnegative real-valued random variable such that $k(\omega) < 1$, and such that $\|_\omega T(\omega) x_1 - T(\omega) x_2\| \leq k(\omega) \|x_1 - x_2\|$ for all $x_1, x_2 \in D(T(\omega))$. If $k(\omega) = k$ (constant) for all ω, then $T(\omega)$ is called a uniform random contraction operator.

Theorem 1.4 Let $\aleph$ be a separable Banach space, and let $T(\omega)$ be a continuous random operator on $\aleph$ to itself such that

$$\mu\left[\bigcup_{m=1}^{\infty} \bigcup_{n=1}^{\infty} \bigcap_{i,j} \bigcap_{r,s} \{\omega : \|T^{rn}(\omega) x_1 - T^{rn}(\omega) x_2\|\right.$$

$$\leq \left(1 - \frac{1}{m}\right) \|x_1 - x_2\|\} \Big] = 1,$$

Where for every $\omega \in \Omega$, $x \in \aleph$, and $n = 1, 2, \ldots$, we put $T^1(\omega) x = T(\omega) x$, and $T^n(\omega) x = T(\omega) [(T^{n-1}(\omega) x]$. Then. There exists an $\aleph$-valued random variable $x(\omega)$ which is the unique fixed point of $T(\omega)$; that is if $x(\omega)$ is another fixed point, then $x(\omega) = x(\omega)$.

PROOF: Let E denote those elements of Ω belonging to the set

$$\bigcup_{m=1}^{\infty} \bigcup_{n=1}^{\infty} \bigcap_{i,j} \bigcap_{r,s} \{\omega : \|T^{rn}(\omega) x_1 - T^{rn}(\omega) x_2\| \leq \left(1 - \frac{1}{m}\right) \|x_1 - x_2\|\}$$

for with $T(\omega)$ is continuous. Clearly $E \subset F$, and by hypothesis, $\mu(E) = 1$. Let the mapping $x(\omega) : \Omega \to \aleph$ be defined as follows : For every $\omega \in E$, $x(\omega)$ is equal to the unique fixed point of $T(\omega)$, and for every $\omega \in \Omega - E$, put $x(\omega) = 0$ (the null element of $\aleph$). Then $T(\omega) x(\omega) = x(\omega)$.

Now, we proceed to establish the measurability of the fixed point $x(\omega)$ Let $x_0(\omega)$ be an arbitrary $\aleph$-valued random variable, and put $x_n(\omega) = T(\omega) x_0(\omega)$. $x_n(\omega)$ is an $\aleph$-valued random variable and a sequence of

Kirk,B. Sims,2013-04-17 Metric fixed point theory encompasses the branch of fixed point theory which metric conditions on the underlying space and or on the mappings play a fundamental role In some sense the theory is a far reaching outgrowth of Banach s contraction mapping principle A natural extension of the study of contractions is the limiting case when the Lipschitz constant is allowed to equal one Such mappings are called nonexpansive Nonexpansive mappings arise in a variety of natural ways for example in the study of holomorphic mappings and hyperconvex metric spaces Because most of the spaces studied in analysis share many algebraic and topological properties as well as metric properties there is no clear line separating metric fixed point theory from the topological or set theoretic branch of the theory Also because of its metric underpinnings metric fixed point theory has provided the motivation for the study of many geometric properties of Banach spaces The contents of this Handbook reflect all of these facts The purpose of the Handbook is to provide a primary resource for anyone interested in fixed point theory with a metric flavor The goal is to provide information for those wishing to find results that might apply to their own work and for those wishing to obtain a deeper understanding of the theory The book should be of interest to a wide range of researchers in mathematical analysis as well as to those whose primary interest is the study of fixed point theory and the underlying spaces The level of exposition is directed to a wide audience including
