## **Ecology Concepts And Applications:**

Ecology Manuel C. Molles (Jr.), James F. Cahill (Jr.), 2014-02      *Ecology* Manuel Carl Molles, 2002 This introductory general ecology text features a strong emphasis on helping students grasp the main concepts of ecology while keeping the presentation more applied than theoretical. An evolutionary perspective forms the foundation of the entire discussion. Evolution is brought to center stage throughout the book as it is needed to support understanding of major concepts. The discussion begins with a brief introduction to the nature and history of the discipline of ecology followed by section I which includes two chapters on natural history: life on land and life in water. The intent is to establish a common foundation of natural history upon which to base the later discussions of ecological concepts. The introduction and natural history chapters can stand on their own and should be readily accessible to most students. They may be assigned as background reading leaving 17 chapters to cover in a one semester course. Sections II through VI build a hierarchical perspective: section II concerns the ecology of individuals; section III focuses on population ecology; section IV presents the ecology of interactions; section V summarizes community and ecosystem ecology; and finally section VI discusses large scale ecology and includes chapters on landscape, geographic and global ecology. These topics were first introduced in section I within a natural history context. In summary, the book begins with the natural history of the planet, considers portions of the whole in the middle chapters and ends with another perspective of the entire planet in the concluding chapter.
