

SPECIES & ECOSYSTEM SURVIVAL

Every species plays a crucial role in the health and survival of its ecosystem. From food production to oxygen generation, pollination to seed dispersal, pest control, disease reduction, and waste recycling, each plant, animal and fungi is part of an intricate web of interconnected life.

Species roles are illustrated here using miombo woodland as an example – a forest type found across much of southern Africa.

8 Every species – including humans – contributes to ecosystem balance. Disturbing this balance can cause some negative consequences. For example, if natural habitat is reduced by humans, strongly territorial like baboons and elephants may become killing people's farms, leading to community hunger. Disturbing habitat also increases the risk of disease transfer to humans.

7 There is a constant cycle of life and death, with many species helping dispose of dead matter, keeping the environment clean and healthy. For example vultures dispose of carcasses, helping prevent the spread of diseases like anthrax and rabies.

6 A healthy ecosystem has a balance of predators that keep pest populations under control. For example crocodiles with as hippos and giraffes eat insects, keeping their populations low. Many reptiles and amphibians reduce the number of insect pests that do damage and fire.

1 Plants absorb carbon dioxide from the air and release oxygen that animals need to survive. Plants store carbon in their leaves, wood, and roots as well as in the soil around them. This reduces the amount of carbon dioxide entering the atmosphere and therefore helps reduce global warming. Plants help maintain water supplies by moving and releasing moisture, reducing floods and droughts.

2 Plants use energy from the sun to convert carbon dioxide and water into glucose. This is the basis of food for almost all species in the world. Miombo woodland has elephants and antelopes eat plants and they can become food for predators like lions and wild dogs.

3 Flowering plants need to be pollinated to reproduce. Different species of insects, birds and mammals pollinate different plants. For example bees and moths pollinate baobab trees and many miombo species are pollinated by bats.

4 Many plants rely on animals to disperse their seeds, enabling new plants to grow. For example elephants, primates and birds eat fruit then deposit the seeds, fertilised by their dung, far from the parent plant.

5 Scavengers recycle everything, with many different species contributing to maintain health. For example, dung beetles collect and bury faeces, eating bacteria back into the soil. Ants dig food and dropping organic matter and bacteria nutrients through their droppings.

Ecosystem Management Mark S. Boyce,Alan W. Haney,1997-01-01 Until recently natural resource management of such commodities as timber and wildlife was driven largely by the desire to exploit these resources During the past three decades however ecologists have warned that this approach to natural resource management could have unforeseen consequences because it ignored how ecosystems function within the landscape Federal agencies that oversee forest and wildlife resources have begun to implement different schemes of ecosystem management schemes that vary enormously among agencies Contributors to this volume leading experts who are agency personnel as well as researchers now clarify the key elements of sound ecosystem management and offer prescriptions for implementing them The authors discuss definitions of ecosystem management sustainability of ecological systems landscape ecology resource management at different scales and in an ecosystem context new advances in computer technology that facilitate classification schemes for ecosystems ecosystem restoration biological diversity and public concerns Throughout the experts agree that management practices must be sustainable that production of commodities such amenities as recreation and aesthetics and biodiversity must not be allowed to decline over time **Ecosystem Management** Richard Sheppard Mitchell,Charles J. Sciences, Board on Environmental Studies and Toxicology, Committee on Scientific Issues in the Endangered Species Act, 1995-10-13 The Endangered Species Act (ESA) is a far-reaching law that has sparked intense controversies over the use of public lands, the rights of property owners, and economic versus environmental benefits. In this volume, a distinguished committee focuses on the science underlying the ESA and offers recommendations for making the act more effective. The committee provides an overview of what scientists know about extinction and what this understanding means to implementation of the ESA. Habitat destruction, conservation, and fundamental importance to the ESA is explored in detail. The book analyzes concepts of species, how the term species arose, and how it has been interpreted for purposes of the ESA. Conflicts between species when individual species are identified for protection, including several case studies, are assessed. Extinction risk and decisions under the ESA, how these decisions can be made more effectively, are discussed. The book concludes with a look beyond the Endangered Species Act and suggests additional means of biological conservation and ways to reduce conflicts. It will be useful to policymakers, regulators, scientists, natural resource managers, industry, and environmental organizations and those interested in biological conservation. **Urban Biodiversity** Erik Kiviat, Kristi MacDonald, 2022-07-26

In a case study of urban biodiversity, Erik Kiviat and Kristi MacDonald present two decades of data and assessment of the habitats and biota of the Meadowlands. *Urban Biodiversity: The Natural History of the New Jersey Meadowlands* documents the mammals, birds, reptiles, amphibians, fish, butterflies, bees, dragonflies, seed plants, mosses, and lichens of the Meadowlands region and their patterns of occurrence. The work records the natural history of an urban industrial region, helping decision makers foster the biodiversity that thrives in cities and giving planners tools to reduce the biological degradation that occurs with urbanization. Vegetation Monitoring Caryl L. Elzinga, Angela G. Evenden, 1998-05. This annotated bibliography documents literature addressing the design and implementation of vegetation monitoring. It provides resources, managers, ecologists, and scientists access to the great volume of literature addressing many aspects of vegetation monitoring, planning, and objective setting, choosing vegetation attributes to measure, sampling design, sampling methods, statistical and graphical analysis, and communication of results. Over half of the 1400 references have been annotated. Keywords pertaining to the type of monitoring or method are included with each bibliographic entry.
