*Economic Policy and Climate Change* Paul Koutstaal, 1997 Economic Policy and Climate Change focuses on the design implementation and consequences of a feasible system of tradable carbon permits to reduce greenhouse gas emissions within the context of the European Union Economic instruments are considered fundamental in reducing atmospheric pollution especially carbon dioxide emissions This important book outlines the design of an achievable system of tradable emission permits in the EU It considers the distribution of permits the problem of monitoring and enforcement and the possibility that the system might create a barrier to potential entrants to industry This is especially important because entry barriers will affect the whole economy and long term industry dynamics The analysis then extends to consider the use of tradable permits and taxes in the context of international cooperation on emissions reduction International agreements are examined within the framework of a second best two country model in which governments reduce emissions and raise revenue simultaneously The author concludes that it is not welfare maximizing to trade permits between countries if emission limits and side payments have not first been agreed This book will be of special interest to environmental economists environmentalists and policymakers

*European Emissions Trading in Practice* Stefano Clò, 2011 Emission markets are crucial both to provide the right incentives to reduce GHG emissions and to fund investments necessary for a transition to a low carbon world Emission markets however cannot achieve these objectives if inappropriately designed This book is a novel and fresh attempt to look at the real functioning of the EU Emission Trading Scheme and to assess its effectiveness and inconsistencies its positive and

negative impacts on industrial and financial markets With the overall objective to improve its design and performance Carlo Carraro University of Venice Italy this important book has the great achievement of addressing a complicated and socially highly debated issue of how society could be given optimal incentives for emission reductions from a legal and economic perspective Moreover it not only addresses the various issues from a theoretical perspective but provides important empirical evidence on the working of emissions trading as well The book will undoubtedly have important lessons not only at the theoretical level but also for policy makers interested in improving the effectiveness of emission trading schemes From the foreword by Michael Faure This unique and up to date book analyses the functioning of the European Emissions Trading Scheme ETS and assesses the extent to which relevant legislation has affected its capacity to promote cost effective reduction of European carbon emissions The author investigates whether inefficiency has been caused by both the ETS cap setting procedure and by the ETS relevant allocation rule as defined by Directive 2003 87 EC He then considers whether the new Directive 2009 29 EC which reforms the ETS institutional design is likely to improve the scheme s effectiveness by reducing the risk of carbon leakage which could potentially be a consequence of implementing a unilateral policy across the asymmetric political landscape of Europe This well documented book will appeal to researchers and postgraduate students in environmental law and environmental economics as well as policymakers within environment industry and economics and electric and industrial operators and stakeholders Environmental NGOs energy and environmental consulting groups members of the European Commission and energy and environmental think tanks will also find much to interest them in this insightful book
