Enzymes In Carbohydrate Synthesis:

Enzymes in Carbohydrate Synthesis Mark D. Bednarski, American Chemical Society. Meeting, 1991 Not only assessing the past present and future uses of enzymes to synthesize carbohydrates this volume also illustrates the significance of carbohydrate chemistry and describes how the combination and use of modern enzyme chemistry can advance exploration in the field Details research at the interface of chemistry and biology for carbohydrate chemistry by demonstrating how to integrate chemical reactions and biological techniques that can be used to synthesize complex bioactive monosaccharides oligosaccharides and glycoconjugates Of particular interest are chapters by George Whitesides and Chi Huey Wong covering the use of enzymes in monosaccharide synthesis and Hindsgaul Thiem Nilsson and Whitesides describing the use of activated sugar nucleosides and glycosyltransferases in the synthesis of oligosaccharides and polysaccharides *Enzymes in Carbohydrate Synthesis* John Robert Durrwachter, 1988 Enzymes in Carbohydrate Synthesis Chun-Hung Lin, 1995 In this thesis the synthetic utility of enzymes as catalysts for carbohydrate synthesis was explored Sialic acid aldolase was applied to make high carbon monosaccharides This study included the discovery that re face attack on the acceptor carbonyl was observed toward scL sugar substrates instead of si face attack toward scD sugar substrates i e the opposite stereoselectivity occurred with enantiomeric substrates Examination of the product distribution during the course of enzymatic reactions revealed that the stereoselectivity is thermodynamically controlled CTP CMP 3 deoxy scD manno octulosonate cytidyltransferase CMP KDO synthetase was prepared for the synthesis of cytidine 5 monophospho 3 deoxy scD manno octulosonic acid CMP KDO and analogs The nature product of the enzyme CMP KDO is unstable Of several KDO analogs tested as substrates for this enzyme 5 fluoro 2 keto 3 5 dideoxyoctulosonic acid 5 FKDO was found to be a good substrate The synthesis and characterization of the product CMP 5 FKDO represents the first stable CMP KDO analog prepared enzymatically to date A mechanism was proposed to explain the instability of CMP KDO A sialyl Lewis x dimer was synthesized enzymatically in three steps from an N linked oligosaccharide prepared from egg yolk Treatment of delipidated hen egg yolk with the protease orientase and neuraminidase gave a dimeric N acetylglucosamine containing oligosaccharide linked to asparagine Addition of sialic acid and fucose catalyzed by alpha 2 3 sialyltransferase and alpha 1 3 fucosyltransferase provided the dimeric sialyl Lewis x an active inhibitor of E selectin with IC₅₀ of 0.75 mM In the enzymatic sulfation of polyfunctional biomolecules 3 phosphoadenosine 5 phospho sulfate PAPS is a key intermediate and cofactor In order to accomplish the regioselective sulfation of oligosaccharides ATP sulfurylase APS kinase and Nod factor sulfotransferase were cloned and overexpressed in Escherichia coli The first two enzymes were used in the mmol scale synthesis of PAPS with regeneration of ATP Additionally PAPS was further used in the enzymatic sulfation of N N diacetylchitobiose catalyzed by a recombinant Nod factor sulfotransferase which was coupled with regeneration of PAPS from 3 phosphoadenosine 5 phosphate PAP *Carbohydrate-Active Enzymes* K.-H. Park, 2008-09-23 Recent advances in

biochemistry and biotechnology have enabled significant progress in basic research on carbohydrate active enzymes and advances in their effective application. The mechanism of catalytic reaction of carbohydrate active enzymes is not fully understood though as they often show unusual substrate specificity and modes of action. This comprehensive collection summarises some of the most important research in the field of carbohydrate active enzymes focusing on the enzymatic reaction mechanism, structure, function, relationship and role in the living organism. The book is based on papers presented in the 2008 Agricultural Biotechnology Symposium Carbohydrate active enzymes structure function and applications held on September 26th-27th 2008 in Seoul National University, Korea. This symposium was organized by the Center for Agricultural Biomaterials, Seoul National University, Korea, which has organized symposia on agricultural biotechnology annually since 1990. Many important results on new types of carbohydrate active enzymes and their applications have been reported at these meetings. Papers in Part one of this collection focus on structure function relationships of carbohydrate active enzymes. Papers in Part two discuss functions and applications of carbohydrate active enzymes such as enzymes for grain processing and glycosidases and their mutants as useful tools for glycoside synthesis. With its distinguished editor and international team of contributors, Carbohydrate active enzymes structure function and applications is an essential reference for research scientists, post graduate students and those in the food industry with an interest in enzymes. Summarises some of the most important research in the field of carbohydrate active enzymes. Covers topics ranging from enzyme classification and structural elucidation to applications of enzymes in food processing and other industries.

Enzymatic Reactions in Organic Media Ari Koskinen,A. Klibanov,1995-12-31 The outlook of organic synthesis has changed many times during its tractable history The initial focus on the synthesis of substances typical of living matter exemplified by the first examples of organic chemistry through the synthesis of urea from inorganic substances by Liebig was accepted as the birth of organic chemistry and thus also of organic synthesis Although the early developments in organic synthesis closely followed the pursuit of molecules typical in nature towards the end of the 19th century societal pressures placed higher demands on chemical methods appropriate for the emerging age of industrialization This led to vast amounts of information being generated through the discovery of synthetic reactions spectroscopic techniques and reaction mechanisms The basic organic functional group transformations were discovered and improved during the early part of this century Reaction mechanisms were elucidated at a growing pace and extremely powerful spectroscopic tools such as infrared nuclear magnetic resonance and mass spectrometry were introduced as everyday tools for a practising organic chemist By the 1950s many practitioners were ready to agree that almost every molecule could be synthesized Some difficult stereochemical problems were exceptions for example Woodward concluded that erythromycin was a hopelessly complex target This frustration led to a hectic phase of development of new and increasingly more ingenious protecting group strategies and functional group transformations and also saw the emergence of asymmetric synthesis
