## **Equivalence Checking Of Digital Circuits Fundamentals Principles Methods:**

**Equivalence Checking of Digital Circuits** Paul Molitor,Janett Mohnke,2007-05-08 Hardware verification is the process of checking whether a design conforms to its specifications of functionality and timing In today's design processes it becomes more and more important Very large scale integrated VLSI circuits and the resulting digital systems have conquered a place in almost all areas of our life even in security sensitive applications Complex digital systems control airplanes have been used in banks and on intensive care units Hence the demand for error free designs is more important than ever In addition economic reasons underline this demand as well The design and production process of present day VLSI circuits is highly time and cost intensive Moreover it is nearly impossible to repair integrated circuits Thus it is desirable to detect design errors early in the design process and not just after producing the prototype chip All these facts are reflected by developing and production statistics of present day companies For example In neon Technologies 118 assumed that about 60% to 80% of the overall design time was spent for verification in 2000 Other sources cite the 3 to 1 head count ratio between verification engineers and logic designers This shows that verifying logical correctness of the design of hardware systems is a major gate to the problem of time to market of 113 With the chip complexity constantly increasing the difficulty as well as the importance of functional verification of new product designs has been increased It is not only more important to get error free designs
