Since its discovery as the cause of infectious mononucleosis in 1964 the Epstein Barr virus EBV has been etiologically implicated in an increasing number of human diseases Generally considered the first human oncogenic virus because of a number of studies linking it with Burkitt's lymphoma and nasopharyngeal carcinoma NPC as well as its documented oncogenicity in nonhuman primates EBV has served as a model for identifying subsequent candidate oncogenic viruses and the stimulus for Evans' revision of the Henle Koch postulates to accommodate the problems in proving viral oncogenicity in humans Research on the role of EBV in human cancer was particularly enhanced by the pioneering work of Werner and Gertrude Henle and by the coordinated efforts of the Special Virus Leukemia Program and its successors the Special Virus Cancer Program and the Virus Cancer Program of the National Cancer Institute NCI Initiated by Dr Frank J Rauscher who subsequently became director of the NCI and is now Vice President of the American Cancer Society and expanded by Dr John B Moloney whose contributions to cancer research were honored at this Second International Symposium on EBV and Associated Malignant Diseases these NCI contract supported programs brought together investigators from all over the world to participate in a joint effort to unravel the mystery of EBV behavior and pathogenicity It was these programs that gave us the opportunity to work with such outstanding people as Professor Yohei Ito to whom this book is dedicated

The Epstein Barr virus EBV isolated in 1966 continues to draw worldwide attention as an important human pathogen Its importance is largely related to the continuing accumulation of evidence that implicates EBV as an etiological factor for certain types of human cancer More recent investigations on this virus have focused on the identity of the viral genes responsible for the different disease manifestations observed following viral infection It is hoped that by thorough investigation of this virus clues to how cancer develops from a normal cell will surface In addition many of the gene products are now being exploited for the development of new and more sensitive tests for the diagnosis and clinical management of individuals with EBV associated diseases Thus studies on this virus continue to provide new information of importance to our understanding of the malignant process In an effort to attract both basic and clinical scientists to the same meeting for purposes of scientific exchange and fostering a closer interaction between these individuals a series of international symposia was initiated in 1984 The first meeting was held in Loutraki Greece and was attended by approximately 100 participants The second international symposium was held in St Petersburg Florida in 1986 and was attended by approximately twice as many participants as attended the Loutraki meeting  
**Epstein-Barr Virus and Human Disease · 1988** D. V. Ablashi, A. Faggioni, G. R. F. Krueger, J. S. Pagano, G. R. Pearson, 2012-12-06 Epstein Barr virus EBV is one of the most widespread human viruses with over 80% of the general population exposed by young adulthood as determined by

antibody studies Initial infection usually occurs during childhood or the teenage years It is clear that depending on the age of the recipient clinical manifestations of the primary infection can vary It has been known for 20 years that EBV is the etiologic agent of acute infectious mononucleosis IM and is also closely associated with African Burkitt's lymphoma BL and nasopharyngeal carcinoma NPC There is increasing evidence that factor in the etiology of B cell lymphomas which arise at a high frequency in immunodeficient populations EBV may also contribute to the development of autoimmune disease Thus this virus continues to attract world wide attention The major target cell for EBV infection has now been conclusively identified as the complement receptor type 2 CR2 the CD21 receptor on B lymphocyte It is apparent however that other cells also can become infected by EBV such as epithelial cells in the parotid gland and other epithelial cells in the upper respiratory tract This might help account for the EBV associated carcinomas of the upper respiratory tract The first in a series of international symposia on EBV associated diseases focused primarily on Burkitt's type lymphomas or on NPC Kyoto 1977 Dusseldorf 1980 Kuala Lumpur 1982 and emphasized mainly the clinical elements of these diseases Subsequent symposia Loutraki 1984 St **Epstein-Barr Virus and Human Disease** P. Craighead,2000-03-15 Pathology and Pathogenesis of Human Viral Disease is a comprehensive reference that examines virus induced clinical disease of humans in the context of the responsible virus and its epidemiology Encompassing everything from cold and flu viruses to sexually transmitted diseases this important resource describes the cellular and tissue pathological changes attributable to infection in the context of the pathogenic mechanisms involved The author provides a comprehensive review of the older and contemporary literature considering both the common and much rarer complications of infection Pathology and Pathogenesis of Human Viral Disease is written from the unique perspective of the clinical pathologist It will help clinicians and pathologists gain a better understanding of changes that occur in viral infected cells tissues and organs It will also serve as a pathology source book for virologists internists and pediatricians Provides a comprehensive worldwide perspective of viral disease pathology Bridges the fields of pathology and virology integrating clinical disease with cell and tissue pathology Addresses topics from the perspective of the clinical pathologist Illustrates unique viral induced pathological lesions Considers common and uncommon complications of infection **Epstein-Barr**

It has been slightly more than two decades since the Epstein Barr virus EBV was discovered by Prof M A Epstein and his colleagues at the University of Bristol in their search for the causative agent of Burkitt s lymphoma For several years EBV was a virus in search of a disease The first documentation that EBV was pathogenic for humans was in 1969 when Drs Gertrude and Werner Henle identified it as the causative agent for infectious mononucleosis Seroepidemiologic and biochemical studies subsequently linked EBV to Burkitt s lymphoma BL nasopharyngeal carcinoma NPC and more recently to the X linked lymphoproliferative syndrome With its widespread pattern of infection and a predilection for producing clinical signs and symptoms in only certain individuals EBV has provided a model for many other candidate oncogenic viruses including papilloma viruses herpes simplex and HTLV LAV In 1975 an international workshop was sponsored by the National Cancer Institute to address the problem of EBV production thus facilitating basic research on the virus This proved to be the last international meeting on EBV for almost a decade In the past progress in both clinical and basic research on EBV has been presented in two types of international meetings the international herpesvirus workshops devoted primarily to basic research on both human and animal herpesviruses and the international symposia on NPC in which EBV related studies were interspersed with clinical epidemiologic and other etiologic aspects of this important human neoplasm **Viral Infections of Humans** Alfred S. parvovirus and retroviruses The book covers the principles and approaches to the study of viral infections in human populations major virus classes of medical and public health importance and neoplastic and other slowly developing diseases due to viral infection     Immunotherapy with Intravenous Immunoglobulins Paul Imbach,2012-12-02 The use of intravenous human antibodies in the treatment of primary immunodeficiencies is well recognized However it is now evident that they also have therapeutic potential for a wide range of other clinical disorders This book describes the use of human antibodies in the management of secondary virus induced immunodeficiencies neonatal and perinatal infections and autoimmunity Insight into their mechanism of action is also provided     The Epstein-Barr Virus M. A. Epstein,B. G. Achong,2012-12-06 The Epstein Barr virus was discovered 15 years ago Since that time an immense body of information has been accumulated on this agent which has come to assume great significance in many different fields of biological science Thus the virus has very special relevance in human medicine and oncology in tumor virology in immunology and in molecular virology since it is the cause of infectious mononucleosis and also the first human cancer virus etiologically related to endemic Burkitt's lymphoma and probably to nasopharyngeal carcinoma In addition continuous human lymphoid cell lines initiated and maintained by the transforming function of the virus genome provide a laboratory tool with wide and ever growing applications Innumerable papers on the Epstein Barr virus have appeared over recent years and reports of work with this agent now constitute a veritable flood The present book provides the first and only comprehensive authoritative overview of all aspects of the virus by authors who have been the original and major contributors in their particular disciplines A complete and up to date survey of this unique and important agent is thus provided which should be of great interest to experts teachers and students engaged in cancer research virology immunology molecular biology epidemiology and cell culture Where topics have been dealt with from more than one of these viewpoints some inevitable overlap and duplication has resulted although this has been kept to a minimum it has been retained in some places because of positive usefulness     *Pediatric Allergy: Principles and Practice E-Book* Donald Y.
