Electronic Structure Calculations on Graphics Processing Units From Quantum Chemistry to Condensed Matter Physics provides an overview of computing on graphics processing units GPUs a brief introduction to GPU programming and the latest examples of code developments and applications for the most widely used electronic structure methods The book covers all commonly used basis sets including localized Gaussian and Slater type basis functions plane waves wavelets and real space grid based approaches The chapters expose details on the calculation of two electron integrals exchange correlation quadrature Fock matrix formation solution of the self consistent field equations calculation of nuclear gradients to obtain forces and methods to treat excited states within DFT Other chapters focus on semiempirical and correlated wave function methods including density fitted second order Møller Plesset perturbation theory and both iterative and perturbative single and multireference coupled cluster methods Electronic Structure Calculations on Graphics Processing Units From Quantum Chemistry to Condensed Matter Physics presents an accessible overview of the field for graduate students and senior researchers of theoretical and computational chemistry condensed matter physics and materials science as well as software developers looking for an entry point into the realm of GPU and hybrid GPU CPU programming for electronic structure calculations

**Advances in Quantum Chemistry** Dag Hanstorp, Hans Persson, Ingvar Lindgren, 1998

**Relativistic Many-Body Theory** Ingvar Lindgren, 2016-04-28 This revised second edition of the author's classic text offers readers a comprehensively updated review of relativistic atomic many body theory covering the many developments in the field since the publication of the original title In particular a new final section extends the scope to cover the evaluation of QED effects for dynamical processes The treatment of the book is based upon quantum field theory and demonstrates that when the procedure is carried to all orders of perturbation theory two particle systems are fully compatible with the relativistically covariant Bethe Salpeter equation This procedure can be applied to arbitrary open shell systems in analogy with the standard many body theory and it is also applicable to systems with more than two particles Presently existing theoretical procedures for treating atomic systems are in several cases insufficient to explain the accurate experimental data recently obtained particularly for highly charged ions The main text is divided into three parts In Part I the standard time independent and time dependent perturbation procedures are reviewed This includes a new section at the end of chapter 2 concerning the so called Fock space procedure or Coulomb only procedure for relativistic QED calculations This is a procedure on an intermediate level frequently used in recent time by chemists on molecular systems where a full QED treatment is out of question Part II describes three methods for QED calculations a the standard S matrix formulation b the Two times Green's function method developed by the St Petersburg Atomic Theory group and c the Covariant evolution operator CEO method recently developed by the Gothenburg Atomic Theory group In Part III the CEO method is combined

with electron correlation to arbitrary order to a unified MBPT QED procedure The new Part IV includes two new chapters dealing with dynamical properties and how QED effects can be evaluated for such processes This part is much needed as there has been an increasing interest in the study of QED effects for such processes All methods treated in the book are illustrated with numerical examples making it a text suitable for advanced students new to the field and a useful reference for established researchers
