Relational Database Systems Joachim W. Schmidt, Michael L. Brodie, 2012-12-06 After a long period of research development test and trial relational database management systems are at last being marketed in force The feedback from early installations of these systems is overwhelmingly positive The most frequent comment by users is that productivity has been increased by a significant factor from 5 to 20 times what it was using previous approaches Another comment is that in many cases end users can now handle their own problems by direct use of the system instead of using application programmers as mediators between them and the system As the reputation of relational systems for ease of use and enhanced productivity has grown there has been a strong temptation for vendors of other approaches to exploit the label relational somewhat indiscriminately In some cases the label is being misapplied to a whole data system in others it is being

misapplied to an interface It is therefore worth developing criteria which database management systems DBMSs should have in order to be called relational The Relational Task Group RTG of the American National Standards Institute ANSI undertook such an effort by developing a characterization of RDBMSs and analyzing fourteen DBMSs per this characterization The result of this work is presented in this book The conclusions of the RTG are in agreement with my view that a DBMS should not be called relational unless it satisfies at least the following conditions 1 All information in the database is represented as values in tables

The Architectural Logic of Database Systems Emmanuel J. Yannakoudakis,2012-12-06 If we look back to pre database systems and the data units which were in use we will establish a hierarchy starting with the concept of field used to build records which were in turn used to build higher data units such as files The file was considered to be the ultimate data unit of information processing and data binding monolith Moreover pre database systems were designed with one or more programming languages in mind and this in effect restricted independent development and modelling of the applications and associated storage structures Database systems came along not to turn the above three units into outmoded concepts but rather to extend them further by establishing a higher logical unit for data description and thereby offer high level data manipulation functions It also becomes possible for computer professionals and other users to view all information processing needs of an organisation through an integrated disciplined and methodical approach So database systems employ the concepts field record and file without necessarily making them transparent to the user who is in effect offered a high level language to define data units and relationships and another language to manipulate these A major objective of database systems is to allow logical manipulations to be carried out independent of storage manipulations and vice versa
