Transposable Elements and Genome Evolution Aurélie Hua-Van, Pierre Capy, 2024-09-24 Since their discovery by Barbara McClintock in the mid 20th century the importance of transposable elements in shaping the architecture function and evolution of genomes has gradually been unveiled These DNA sequences populate nearly all genomes and are viewed as genomic parasites They are mobile capable of proliferating within genomes and also commonly travel between species These elements are mutagenic and are responsible for several human genetic disorders but they also constitute a major source of genetic diversity Some insertions have beneficial effects for the host and are selected for giving rise to significant evolutionary innovations Their dynamics within genomes are intricate as are their interactions with other genome components To limit their proliferation the genome has evolved sophisticated defense mechanisms While researchers commonly use these elements as genetic tools their identification in newly sequenced genomes remains a challenge due not only to their extensive diversity but also their large copy numbers

Patterns and Processes of Speciation in Ancient Lakes Thomas Wilke, Risto Väinölä, Frank Riedel, 2009-04-02 Ancient lakes are exceptional freshwater environments that have continued to exist for hundreds of thousands of years They have long been recognized as centres of biodiversity and hotspots of evolution During recent decades speciation in ancient lakes has emerged as an important and exciting topic in evolutionary biology The contributions in this volume deal with patterns and processes of biological diversification in three prominent ancient lake systems Of these the famous East African Great Lakes already have a strong tradition of evolutionary studies but the two other systems have so far received much less attention The exceptional biodiversity of the European sister lakes Ohrid and Prespa of the Balkans has long been known but has largely been neglected in the international literature until recently The rich biota and problems of its evolution in the two central lake systems on the Indonesian island of Sulawesi in turn have only lately started to draw scientific attention This volume aims at deepening the awareness of the unusual biological diversity in ancient lakes in general and of the role of these lakes as natural laboratories for the study of speciation and diversification in particular It should stimulate further research that will lead to a better understanding of key evolutionary processes in these lakes and to knowledge that might help in mitigating the deterioration of their diversity in the future
