Hoc Networks Sudip Misra, Isaac Woungang, Subhas Chandra Misra, 2009-03-02 Overview and Goals Wireless communication technologies are undergoing rapid advancements The past few years have experienced a steep growth in research in the area of wireless ad hoc networks The attractiveness of ad hoc networks in general is attributed to their characteristics features such as ability for infrastructure less setup minimal or no reliance on network planning and the ability of the nodes to self organize and self configure without the involvement of a centralized n work manager router access point or a switch These features help to set up a network fast in situations where there is no existing network setup or in

times when setting up a fixed infrastructure network is considered infeasible for example in times of emergency or during relief operations Even though ad hoc networks have emerged to be attractive and they hold great promises for our future there are several challenges that need to be addressed Some of the well known challenges are attributed to issues relating to scalability quality of service energy efficiency and security

Handbook of Approximation Algorithms and Metaheuristics Teofilo F. Gonzalez, 2007-05-15 Delineating the tremendous growth in this area the Handbook of Approximation Algorithms and Metaheuristics covers fundamental theoretical topics as well as advanced practical applications It is the first book to comprehensively study both approximation algorithms and metaheuristics Starting with basic approaches the handbook presents the methodologies to design and analyze efficient approximation algorithms for a large class of problems and to establish inapproximability results for another class of problems It also discusses local search neural networks and metaheuristics as well as multiobjective problems sensitivity analysis and stability After laying this foundation the book applies the methodologies to classical problems in combinatorial optimization computational geometry and graph problems In addition it explores large scale and emerging applications in networks bioinformatics VLSI game theory and data analysis Undoubtedly sparking further developments in the field this handbook provides the essential techniques to apply approximation algorithms and metaheuristics to a wide

range of problems in computer science operations research computer engineering and economics Armed with this information researchers can design and analyze efficient algorithms to generate near optimal solutions for a wide range of computational intractable problems

Handbook of wireless ad-hoc networks Isaac Alden, A wireless ad hoc network WANET is a decentralized type of wireless network The network is ad hoc because it does not rely on a preexisting infrastructure such as routers in wired networks or access points in managed infrastructure wireless networks Instead each node participates in routing by forwarding data for other nodes so the determination of which nodes forward data is made dynamically on the basis of network connectivity The book Handbook of Wireless Ad Hoc Networks is divided into ten chapters First chapter reviews the existing approaches for AB estimation presenting the efforts and challenges to AB estimation in 802.11 or 802.11 like ad hoc networks The mechanisms to synchronize the local clocks of the nodes in WSN have been extensively investigated in second chapter We introduce a new medical technology paradigm centered on wireless technology and cloud computing in third chapter that was designed to overcome the problems of increasing health technology costs In fourth chapter we bring forward an Active QoS Mechanism AQM the core of it is the negotiation between applications and network and the active intervention for them Fifth chapter focuses on communication in a distributed system such as a WSN The main purpose of communication in WSNs is to retransmit messages and route them to the base station Sixth chapter emphasizes on a number of design aspects of physical layer methods such as modulation and source and channel coding Seventh chapter describes the design and implementation of a wireless neural telemetry system that enables new experimental paradigms such as neural recordings during rodent navigation in large outdoor environments We propose a multi parametric clustering scheme designed to aid in the coordination of sensor nodes within cognitive wireless sensor networks in eighth chapter Ninth chapter goes through a description of the strategies developed so far to handle the problem of communication in strip like topologies Last chapter focuses on system and traffic analysis employed to model the complexity of communication traffic
