Euro-Par 2004 Parallel Processing Marco

Danelutto, Marco Vanneschi, Domenico Laforenza, 2004-12-27 Euro Par Conference Series Euro Par is an annual series of international conferences dedicated to the promotion and advancement of all aspects of parallel computing. The major themes can be divided into the broad categories of hardware, software, algorithms and applications for parallel computing. The objective of Euro Par is to provide a forum within which to promote the development of parallel computing both as an industrial technique and an academic discipline extending the frontier of both the state of the art and the state of the practice. This is particularly important at a time when parallel computing is undergoing strong and sustained development and experiencing real industrial take up. The main audience for and participants at Euro Par are seen as researchers in academic departments, government laboratories and industrial organizations. Euro Par's objective is to be the primary choice of such professionals for the presentation of new results in their specific areas. Euro Par also targets applications demonstrating the effectiveness of parallelism. This year's Euro Par conference was the tenth in the conference series. The previous Euro Par conferences took place in Stockholm, Lyon, Passau, Southampton, Toulouse, Munich, Manchester, Paderborn and Klagenfurt. Next year the conference will take place in Lisbon. Euro Par has a permanent Web site hosting the aims, the organization structure, details as well as all the conference history: <http://www.europar.org>.

Information Processing with Evolutionary Algorithms Manuel Grana,Richard J. Duro,Alicia d'Anjou,Paul P. Wang,2006-03-30 The last decade of the 20th century has witnessed a surge of interest in numerical computation intensive approaches to information processing The lines that draw the boundaries among statistics optimization artificial intelligence and information processing are disappearing and it is not uncommon to find well founded and sophisticated mathematical approaches in application domains traditionally associated with ad hoc programming Heuristics has come a branch of optimization and statistics Clustering is applied to analyze soft data and to provide fast indexing in the World Wide Web Non trivial matrix algebra is at the heart of the last advances in computer vision The breakthrough impulse was apparently due to the rise of the interest in artificial neural networks after its rediscovery in the late 1980s Disguised as ANN numerical and statistical methods made an appearance in the information processing scene and others followed A key component in many intelligent computational processing is the search for an optimal value of some function Sometimes this function is not evident and it must be made explicit in order to formulate the problem as an optimization problem The search then takes place in high dimensional spaces that can be either discrete or continuous or mixed The shape of the high dimensional surface that corresponds to the optimized function is usually very complex Evolutionary algorithms are increasingly being applied to information processing applications that require any kind of optimization
